Extensions of Logic Programming Peter Schroeder-Heister, 1991-02-12 This volume contains finalized versions of papers presented at an international workshop on extensions of logic programming held at the Seminar for Natural Language Systems at the University of Tübingen in December 1989 Several recent extensions of definite Horn clause programming especially those with a proof theoretic background have much in common One common thread is a new emphasis on hypothetical reasoning which is typically inspired by Gentzen style sequent or natural deduction systems This is not only of theoretical significance but also bears upon computational issues It was one purpose of the workshop to bring some of these recent developments together The volume covers topics such as the languages Lambda Prolog N Prolog and GCLA the relationship between logic programming and functional programming and the relationship between extensions of logic programming and automated theorem proving It contains the results of the first conference concentrating on proof theoretic approaches to logic programming

The Method of Socratic Proofs Dorota Leszczyńska-Jasion, 2025-06-13 This book contains a systematic and formal attempt to model solutions to problems such as Is it possible to prove a question Is it possible to prove something by the use of questions Do the existing paradigms in the logic of questions allow one to combine questions and proofs What are the results in this field In developing answers the book focuses on the applications of the method of Socratic proofs and goes beyond that It starts out with an overview of the leading paradigms issues problems and ready solutions in the logic of questions and places Inferential Erotetic Logic and the method of Socratic proofs against a wider background It then introduces these two methods in more detail and explains how they can be used for classical logic intuitionistic propositional logic and for basic modal logics Next the book deals with issues specific to the field of the logic of questions introducing the tools of Minimal Erotetic Semantics MiES The final chapters describe the translations between proof systems from a Socratic transformation derived in an erotetic calculus into a sequent system

Christian Logic Stephen Wuest, 2024-10-25 This text is about fusing logic and moral theory and is definitely from a Christian worldview It is written on a level for AP high school or at most second year college use But the text is for Christian laypeople The goals of this book include presenting modern deductive logic modern logical notation and the twenty rules of inference These describe what modern deductive logic is However orthodox Christians must go further they must be exposed to historical moral ethical ME models And they must think carefully about how to integrate Christian morality into modern logic and use this fusion to have a sound methodology to analyze modern arguments Given the popularity of logically incoherent conspiracy theories this approach to formal logic enters through the door of what historical Christians would call roughly our shared reality Also given the abundance of partial or invalid or unsound arguments that Americans encounter the analysis of arguments in this book will heavily deal with dysfunctional arguments Putting these topics together in a synthesized way in a Christian worldview results in a product that reasons across disciplines and is perhaps politically incorrect But the author is convinced that this combination of skills is what American Christians need

On the Logic and Learning of Language Sean A. Fulop, 2004 This book presents the author's research on automatic learning procedures for categorial grammars of natural languages The research program spans a number of intertwined disciplines including syntax semantics learnability theory logic and computer science The theoretical framework employed is an extension of categorial grammar that has come to be called multimodal or type logical grammar The first part of the book presents an expository summary of how grammatical sentences of any language can be deduced with a specially designed logical calculus that treats syntactic categories as its formulae Some such Universal Type Logic is posited to underlie the human language faculty and all linguistic variation is captured by the different systems of semantic and syntactic categories which are assigned in the lexicons of different languages The remainder of the book is devoted to the explicit formal development of computer algorithms which can learn the lexicons of type logical grammars from learning samples of annotated sentences The annotations consist of semantic terms expressed in the lambda calculus and may also include an unlabeled tree structuring over the sentence The major features of the research include the

following We show how the assumption of a universal linguistic component the logic of language is not incompatible with the conviction that every language needs a different system of syntactic and semantic categories for its proper description The supposedly universal linguistic categories descending from antiquity noun verb etc are summarily discarded Languages are here modeled as consisting primarily of sentence trees labeled with semantic structures a new mathematical class of such term labeled tree languages is developed which cross cuts the well known Chomsky hierarchy and provides a formal restrictive condition on the nature of human languages The human language acquisition mechanism is postulated to be biased such that it assumes all input language samples are drawn from the above syntactically homogeneous class in this way the universal features of human languages arise not just from the innate logic of language but also from the innate biases which govern language learning This project represents the first complete explicit attempt to model the acquisition of human language since Steve Pinker's groundbreaking 1984 publication *Language Learnability and Language Development*

Logical Dynamics of Information and Interaction Johan van Benthem, 2011-09-29 This book develops a view of logic as a theory of information driven agency and intelligent interaction between many agents with conversation argumentation and games as guiding examples It provides one uniform account of dynamic logics for acts of inference observation questions and communication that can handle both update of knowledge and revision of beliefs It then extends the dynamic style of analysis to include changing preferences and goals temporal processes group action and strategic interaction in games Throughout the book develops a mathematical theory unifying all these systems and positioning them at the interface of logic philosophy computer science and game theory A series of further chapters explores repercussions of the dynamic stance for these areas as well as cognitive science

Introduction to Logic Jess Drake, 2018-05-30 Logic originally meaning the study of the form of arguments is generally held to consist of the systematic study of the form of arguments A valid argument is one where there is a specific relation of logical support between the assumptions of the argument and its conclusion There is no universal agreement as to the exact scope and subject matter of logic but it has traditionally included the classification of arguments the systematic exposition of the logical form common to all valid arguments the study of inference including fallacies and the study of semantics including paradoxes Historically logic has been studied in philosophy and mathematics

and recently logic has been studied in computer science linguistics psychology and other fields The book is about the logic and talks about various aspects of it such as general character of the enquiry argument from analogy mathematical reasoning etc This book will prove to be very useful for the people interested in logic as well as the students of logic **Fundamentals**
