Sachs,2013-03-09 There exist essentially two levels of investigation in theoretical physics One is primarily descriptive concentrating as it does on useful phenomenological approaches toward the most economical classifications of large classes of experimental data on particular phenomena The other whose thrust is explanatory has as its aim the formulation of those underlying hypotheses and their mathematical representations that are capable of furnishing via deductive analysis predictions constituting the particulars of universals the asserted laws about the phenomena under consideration The two principal disciplines of contemporary theoretical physics quantum theory and the theory of relativity fall basically into these respective categories General Relativity and Matter represents a bold attempt by its author to formulate in as transparent and complete a way as possible a fundamental theory of matter rooted in the theory of relativity where the latter is viewed as providing an explanatory level of understanding for probing the fundamental nature of matter in domains ranging all the way from fermions and less to light years and more We hasten to add that this assertion is not meant to imply that the author pretends with his theory to encompass all of physics or even a tiny part of the complete objective understanding of our accessible universe But he does adopt the philosophy that underlying all natural phenomena there is a common conceptual basis and then proceeds to investigate how far such a unified view can take us at its present stage of development
