Official Gazette of the United States Patent and Trademark Office, 1998 Popular Science, 2007-05 Popular Science gives our readers the information and tools to improve their technology and their world The core belief that Popular Science and our readers share The future is going to be better and science and technology are the driving forces that will help make it better *Australian Viticulture*, 1996 Radar Imaging of the Ocean Waves Mikhail B. Kanevsky, 2008-09-15 This book is dedicated to studying the ocean with radar tools in particular with space radars Being intended mainly for the scientists preoccupied with the problem as well as senior course students it concentrates and generalizes the knowledge scattered over specialized journals The significant part of the book contains the results obtained by the author Systematically collects and describes the approaches used by different laboratories and institutions Deals with the physics of radar imagery and specifically with ocean surface imagery Useful for students and researchers specializing in the area of ocean remote sensing using airborne or space borne radars both SAR and RAR **Autocar & Motor**, 1990-03 **Actinobacteria, a Source of Biocatalytic Tools** Dirk Tischler, Willem J. H. van Berkel, Marco W. Fraaije, 2019-08-12 Actinobacteria Actinomycetes represent one of the largest and most diverse phyla among Bacteria The remarkable diversity is displayed by various lifestyles distinct morphologies a wide spectrum of physiological and metabolic activities as well as genetics Interestingly most Actinobacteria have a high GC content ranging from 51% to 70% and belong to Gram positive or Gram variable type microbes Many species are well known for large genomes which may be of linear style as in case of rhodococci or circular

Many of those harbor linear megaplastids as a kind of genetic storage device. Frequently gene redundancy is reported and in most cases the evolutionary history or a functional role remains enigmatic. Nevertheless these large genomes and megaplastids provide access to a number of potential homologous biocatalysts which await elucidation. Actinobacteria are well known for their biotechnological potential which is exemplarily described for amino acid producing *Corynebacteria*, secondary metabolite producing *Streptomyces*, pathogenic targets as *Nocardia* and *Mycobacteria*, carotenoid building *Micrococcus* strains, acid fermenting *Propionibacteria*, health and food related *Bifidobacterium* strains, rubber degrading *Gordonia* species and organic pollutant degrading rhodococci among others. In many cases individual pathways or enzymes can be modified or recombinantly employed for biocatalysis. Even some genetic tools to work directly in those microbes have been successfully used as for example in *Corynebacterium* or in *Rhodococcus* species. During the last decade more and more genomes have been sequenced and made available for data mining and become accessible by state of the art genomic manipulation methods as minimal genomes, knock out or artificial evolution. With respect to this large and ancient phylum many questions can be asked either from a scientific or industrial point of view. In order to provide some crystallization points we like to raise some examples as follows: How small can be an actinobacterial genome? What is the driving force to comprise large and repetitive genomes, megaplastids? What is needed to generate an actinobacterial power house for industry? Can we annotate novel biocatalysts from scratch and improve functional annotation? What are common and different features with respect to other bacteria and/or fungi? How many novel antibiotics are hidden among Actinobacteria? Is there more potential among extremophile members or are they only specialized? Here especially the production of natural compounds is of high interest.
