Elements of Survey Sampling R. Singh, Naurang Singh Mangat, 2013-03-09 Modern statistics consists of methods which help in drawing inferences about the population under consideration These populations may actually exist or could be generated by repeated experimentation The medium of drawing inferences about the population is the sample which is a subset of measurements selected from the population Each measurement in the sample is used for making inferences about the population The populations and also the methods of sample selection differ from one field of science to the other Social scientists use surveys to collect the sample information whereas the physical scientists employ the method of experimentation for obtaining this information This is because in social sciences the factors that cause variation in the measurements on the study variable for the population units can not be controlled whereas in physical sciences these factors can be controlled at least to some extent through proper experimental design Several excellent books on sampling theory are available in the market These books discuss the theory of sample surveys in great depth and detail and are suited to the postgraduate students majoring in statistics Research workers in the field of sampling methodology can also make use of these books However not many suitable books are available which can be used by the students and researchers in the fields of economics social sciences extension education agriculture medical sciences business management etc These students and workers usually conduct sample surveys during their research projects *Contemporary Bayesian and Frequentist Statistical Research Methods for Natural Resource Scientists* Howard B. Stauffer, 2007-12-10 The first all inclusive introduction to modern statistical research methods in the natural resource sciences The use of Bayesian statistical analysis has become increasingly important to natural resource scientists as a practical tool for solving various research problems However many

important contemporary methods of applied statistics such as generalized linear modeling mixed effects modeling and Bayesian statistical analysis and inference remain relatively unknown among researchers and practitioners in this field Through its inclusive hands on treatment of real world examples Contemporary Bayesian and Frequentist Statistical Research Methods for Natural Resource Scientists successfully introduces the key concepts of statistical analysis and inference with an accessible easy to follow approach The book provides case studies illustrating common problems that exist in the natural resource sciences and presents the statistical knowledge and tools needed for a modern treatment of these issues Subsequent chapter coverage features An introduction to the fundamental concepts of Bayesian statistical analysis including its historical background conjugate solutions Bayesian hypothesis testing and decision making and Markov Chain Monte Carlo solutions The relevant advantages of using Bayesian statistical analysis rather than the traditional frequentist approach to address research problems Two alternative strategies the a posteriori model selection strategy and the a priori parsimonious model selection strategy using AIC and DIC to model selection and inference The ideas of generalized linear modeling GLM focusing on the most popular GLM of logistic regression An introduction to mixed effects modeling in S Plus and R for analyzing natural resource data sets with varying error structures and dependencies Each statistical concept is accompanied by an illustration of its frequentist application in S Plus or R as well as its Bayesian application in WinBUGS Brief introductions to these software packages are also provided to help the reader fully understand the concepts of the statistical methods that are presented throughout the book Assuming only a minimal background in introductory statistics Contemporary Bayesian and Frequentist Statistical Research Methods for Natural Resource Scientists is an ideal text for natural resource students studying statistical research methods at the upper undergraduate or graduate level and also serves as a valuable problem solving guide for natural resource scientists across a broad range of disciplines including biology wildlife management forestry management fisheries management and the environmental sciences
