How the Endocrine System Works

Endocrine glands are groups of cells that secrete hormones into the bloodstream. **Hormones** are chemicals that help regulate many of your body's functions. During puberty, hormones trigger physical and emotional changes in the body. Some hormones also control growth. Abnormally high or low amounts of these hormones may be a factor in growth disorders. Factors such as stress, infection, and changes in fluid balance may also affect hormone levels. Hormones work to maintain balances in the body so that important functions can take place. The figure on page 227 describes the major glands of the endocrine system and the body functions they control. 

What is the function of the pituitary gland?

The pituitary gland is also known as the master gland. It controls the activities of all other glands. The pituitary gland has three sections, or lobes.
