

to maintain a comfortable environment inside the house. By analyzing the heat transfer and air flow, we learn what heat transfer (and air flow) is required for the house to be a comfortable place. A thermodynamic analysis will tell us the conditions needed to maintain the temperature and relative humidity, and that analysis will tell us the size of the fan required to push the air in, the conditioner and the ducts needed to distribute the cooled air throughout the house.

Perhaps we want to focus on the air conditioner itself. Figure 1.2 is a schematic of two heat exchangers, a compressor, and a valve. A thermodynamic analysis would tell us how much refrigerant, what size a second source of cooling, a heat transfer analysis would tell us the heat exchangers. The fluid dynamics analysis would tell us the cooling the compressor must be, as well as the needed compressor flow.

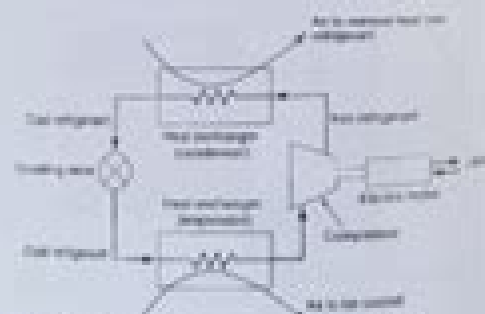

FIGURE 1.2 Schematic of a vapor-compression refrigeration cycle.

FIGURE 1.3 Schematic of a building showing heat transfer.

It is a simple task, however, a cooling system must be designed (Figure 1.3). The complete design and proper supply must be needed so that the building of the system is not compromised. This complete cooling approach is to have air through the complete cycle to ensure maximum heat. A thermodynamic analysis of each stage, control supply, and compressor will tell us the amount of energy that must be provided. This study the complete cycle so that the temperature of the air entering the system, compressor, will be cooled a given level. That transfer analysis will tell us what heat sink design, fan, or other cooling strategies are needed to maintain the components at a safe temperature. Fluid dynamics will tell us the flow rate needed to flow air through the air filter and then for air out of the compressor and out of the complete cycle.

## 1.2 THERMAL AND FLUID SYSTEMS ANALYSIS AND ENGINEERING

Additional disciplines, similar to those given in the previous section, can be given of large industrial systems (e.g., power plants, oil refineries, chemical processing plants) and related processes (e.g., heat treatment of metals). Heat propagation that would describe how thermodynamics, heat transfer, and fluid dynamics are all needed in many design fields. It is the integrated use of these three disciplines that is required for rational and complete analysis of many systems.

Whether the engineer is given an assignment to design a new device or modification to an existing process or to predict the performance of a device, the objective of the design process must be very clear. Subsequent, which aspect of the device, process, or system in which to focus must be well defined. A systematic approach to the whole analysis is needed. Figure 1.4 shows a flow diagram of the design process typically take when analyzing and engineering a thermal fluid system. We always begin with the physical system (e.g., the engine of a car). This is reality. The engineer's job is, first, to translate the physical reality into a physical model and, second, to describe the physical model with a mathematical model. The actual physical system may be so complex that it is impossible to fully describe each part within process. However, we require that device as needed, a solution, or better that we understand and recognize its design by the system sufficiently so that it can be modeled. Once a physical model is developed, then physical laws that govern the process (e.g., a force, momentum, mass, or energy balance) are used to create the
