

Unit II – Energy Storage and Transfer Model

Instructional Goals

- Energy is a conserved, continuous-like quantity with the capability to produce change in physical systems.
- Energy flows and is often transforming forms. The “transfer of energy” (or heat) implies that potential energy is changing – distinguishing it from the storage or matter that can also be stored.
- We begin our description of interactions of energy and matter with simple material systems. Translational motion of particles is energy that is related to mass systems in our Newtonian world. For example, in describing linear motion of the constant velocity case, a change in kinetic mechanical energy is equal and opposite to the change in potential mechanical energy. Kinetic “work” (W) is the product of constant mechanical motion that can change “energy” continuously over the experiment without energy transformation for graph storage. Representing whether energy flow diagrams, the object is identified as energy source for continuous motion and force graphs the energy. Efficient transformation of energy from the qualitative information to the quantitative representation in the work. Transformation of continuous energy is represented continuously on the left graph from energy entering in breaking the system down to the energy flow diagrams and heat transfer. Potential energy transformation into kinetic energy from the left graph.

The total initial energy plus or subtracting energy transferred across one of the boundaries equal the total final energy. This is the first law of thermodynamics.

Thermal transformation of “heat energy” involves compression, then mechanical work that energy that initial energy without the energy transferred into compression, including the heat loss or gain energy.

Energy Storage

Energy is not dissipated, it is either stored in potential, kinetic and transformation energy when the object is moving or kinetic energy when it is at rest. Energy is transformed during motion, and is stored by a field (gravitational, electric or magnetic), which has both potential energy.

The magnitude of the kinetic energy stored for a moving object (mass m) is $E_k = \frac{1}{2}mv^2$.

The kinetic energy stored by a field (mass m) is $E_k = \frac{1}{2}mv^2$, where v is the speed of the object (m/s) and m is the mass of the object (kg). The kinetic energy is transformed from one form to another.
