

HNH1 Biology – Section 3.2.5 Primate Evolution

Name: _____

As you read through this section in your textbook, answer the following questions.

Main Ideas	Vocabulary
<ul style="list-style-type: none"> Humans share a common ancestor with other primates. There are many fossils of extinct hominins. Modern humans arose roughly 200,000 years ago. 	<ul style="list-style-type: none"> Primate Prosimian Anthropoid

- Humans share a common ancestor with other primates.
- What is a primate? Explain how humans fit this definition.

Primate Evolution

Consider all other group and related organisms, the relationship among the primate group forms a many-branched tree. At the tree's base is the common ancestor of all primates. Just above this base, the tree splits into two main subgroups: the prosimians and the anthropoids.

- What are the differences between prosimians and anthropoids?
- How are hominids different from other anthropoids?

Working Together

Animals that can walk on two legs are called bipedal. This trait has important adaptive advantages. It allows higher reach into tree branches while foraging, and perhaps most importantly, it frees the hands for foraging, carrying infants and food, and using tools.

- Compare the larger brains and tool use, which did being bipedal occur in hominids? What evidence is there for this?

Handbook of Fish Biology and Fisheries Paul J. B. Hart, John D. Reynolds, 2008-04-15

Recent decades have witnessed strong declines in fish stocks around the globe amid growing concerns about the impact of fisheries on marine and freshwater biodiversity. Fisheries biologists and managers are therefore increasingly asking about aspects of ecology, behaviour, evolution, and biodiversity that were traditionally studied by people working in very separate fields. This has highlighted the need to work more closely together in order to help ensure future success both in management and conservation. The Handbook of Fish Biology and Fisheries has been written by an international team of scientists and practitioners to provide an overview of the biology of freshwater and marine fish species together with the science that supports fisheries management and conservation. This volume, subtitled Fisheries, focuses on a wide range of topics including the history of fisheries science, methods of capture, marketing, economics, major models used in stock assessments and forecasting, ecosystem impacts, marine protected areas, and conservation. It builds on material in Volume 1, Fish Biology, which ranges from phylogenetics and biogeography to physiology, recruitment, life histories, genetics, foraging, reproductive behaviour, and community ecology. Together, these books present the state of the art in our understanding of fish biology and fisheries and will serve as valuable references for undergraduates and graduates looking for a comprehensive source on a wide variety of topics in fisheries science. They will also be useful to researchers who need up-to-date reviews of topics that impinge on their fields and decision makers who need to appreciate the scientific background for management and
