

4. The variable domain V of the mature immunoglobulin light chain protein is encoded by
-V and J gene segments forming one exons

26. The process used to produce either surface or secreted forms on the immunoglobulin heavy chain is called
-Alternative RNA processing

36. What are the main antigen presenting cells (APC's) in the human body? How are they distributed in the secondary lymphoid tissues ie at what specific site in the lymphoid tissues do you find APCs?

- macrophages, B cells, and dendritic cells are the main antigen presenting cells or APC's of the human body. These APC's are distributed in secondary lymphoid tissue via bone marrow, they also collaborate with the thymus derived lymphocytes. Antigens are processed by APC's that get reformed so the T cell(s) can recognize them to protect against further/ later alterations with the same virus. This process makes it so the antigen is transported to the plasma membrane. CD4 membrane markers are on the cells that recognize.

37. List the major processes with potentials on increasing BCR or antibody diversity
-somatic recombination
-isotype switching
- affinity maturity
-generation of junctional diversity during the gene rearrangement

38. Explain how a vast number of immunoglobulins of different antigen specifics can be produced from the relatively small number of immunoglobulin genes present in the genome. Include the following terms in your explanation: somatic recombination, germline configuration, V, D, and J segments

- The way a vast number of immunoglobulins
- 1 different antigen specificities can be
- produced from the relatively small number of immunoglobulin genes present in the genome is by multiple V genes, V,D, and J recombination, V J recombination. Both domains are separately coded by the V-gene segments and C-gene segments respectively. In the light chain Variable region it is coded by two separate gene segment which contain the variable segment and a V and a small joining segment J. The Heavy chain variable region are coded by three gene segments which contain V-gene segment, D gene segment, and J gene segment, and C (constant) region exons regions of Ig. Thy He recombination or the V D) recombination is one of the processes th contributes to the diversity in immunoglobulins. The V D J recombination process til place in the bone marrow and thymus for B-cells and T-celly respectively. The V region germline DNA is highly susceptible to a high rate of somatic mutation during B cell development in response to antigen challenge. These mutations allow B cell clones fo produce antibodies with different polypeptide sequences. During the B-cell mutation: DNA sollicing occurs and one of the genes from

The Present and Future of Immunology Education Andrea Bottaro,Deborah M. Brown,John Gregory Frelinger,2022-01-24 The explosion of basic and applied immunology in the first decades of the 21st century has brought forth new opportunities and challenges for immunology education at all academic levels from professional to undergraduate medical graduate and post graduate instruction Moreover developing methods and techniques for educating general audiences on the importance and benefits of immunology will be critical for increasing public awareness and support One major immediate challenge consists in accommodating within the confines of traditional immunology curricula a body of knowledge that continues to grow exponentially in both size and complexity Furthermore the practical toolbox of immunological research has vastly expanded and even in the present environment of highly interdisciplinary and collaborative science future immunologists will likely need to be at least conversant in for instance computational structural and system biology nanotechnology and tissue engineering At the same time our perspective of the immune system has progressively developed from primarily a host defense mechanism to a fundamental homeostatic system with organism wide physiological and clinical significance and with potentially transformative biotechnological and therapeutic applications As a consequence in addition to stand alone courses immunology is increasingly integrated into other courses or distributed longitudinally throughout a multi year curriculum This necessitates inter disciplinary approaches to reach an expanding range of disciplines as diverse as neurobiology cancer

biology oncology infectious diseases pharmacology orthopedics and bioengineering Creative approaches and pedagogical flexibility will be needed to avoid the pitfall of one size fits all instruction and to tailor level and discipline appropriate content to different types of students using multiple teaching formats Finally like most other disciplines immunology education is also under strong pressure to introduce new didactic strategies that are relevant and meaningful to a generation of students who are digital natives comfortable with and expect on demand and multi modal learning diversified sources and active engagement Thankfully the dynamic and interactive behavior of immune system cells now visualized with striking immediacy by in vivo imaging has the ability to capture and hold the interest of even the most jaded learner The need for an increasingly immunology knowledgeable workforce not just academic and industry scientists but also clinical and research lab technicians biomedical engineers and physicians in a growing array of specialties will also expand job opportunities for immunologists as educators and for content creators dedicated to generating new didactic tools in this field

Chernyak,1991-07-25 This fascinating intellectual history is the first critical study of the work of Elie Metchnikoff the founding father of modern immunology Metchnikoff authored and championed the theory that phagocytic cells actively defend the host body against pathogens and diseased cells His program developed from comparative embryological studies

that sought to establish genealogical relations between species at the dawn of the Darwinian revolution In this scientific biography Tauber and Chernyak explore Metchnikoff's development as an embryologist showing how it prepared him to propose his theory of host pathogen interaction They discuss the profound impact of Darwin's theory of evolution on Metchnikoff's progress and the influence of 19th century debates on vitalism teleology and mechanism As a case study of scientific discovery this work offers lucid insight into the process of creative science and its dependence on cultural and philosophic sources Immunologists and historians of science and medicine will find it an absorbing and accessible account of a remarkable individual
