Interspecific and Intraspecific Variation in Picea Engelmannii and Its Congeneric Cohorts G. E. Rehfeldt, 2004 A series of common garden studies of 336 populations representing *Picea engelmannii* *P. pungens* *P. glauca* *P. mexicana* and *P. chihuahuana* provided as many as 13 growth and morphologic characters pertinent to biosystematics and genecology Canonical discriminant analyses discretely segregated populations of *P. pungens* and *P. chihuahuana* while positioning *P. engelmannii* populations along a continuum anchored by Southwestern United States populations at one extreme and those classified as hybrids of *P. engelmannii* with *P. glauca* on the other A population of *P. mexicana* was closely aligned with Southwest populations of *P. engelmannii* while populations of *P. glauca* were intermixed with and peripheral to those identified as hybrid While consistent with most taxonomic treatments of these taxa the analyses nonetheless suggested that Southwestern United States populations should be considered as a variety of *P. engelmannii* that most likely should include *P. mexicana* Genecological analyses detected ample genetic variation among the 295 populations in the *P. engelmannii* complex The analyses demonstrated that populations were distributed along clines driven primarily by the winter temperature regime of the provenance For northern populations summer temperatures also became a key factor in accounting for genetic differences among populations Analyses also detected clines for the 19 *P. pungens* and 23 *P. glauca* populations An assessment of the effects of global warming according to the IS92a scenario of two general circulation models demonstrated for the current century 1 an increasingly favorable climate for *P. pungens* as its distribution moves upward in elevation throughout much of the Great Basin Colorado Rockies and mountain islands of the Southwest 2 a widespread reduction in the areal extent of *P. engelmannii* in the inland Northwestern United States to the extent that *Picea* may become rare in the local

flora 3 extirpation of *P. glauca* from the Black Hills and Cypress Hills and 4 a widespread redistribution of genotypes across the landscape as contemporary populations adjust genetically to change
