

Lesson 12: Solving Equations

Student Outcomes

- Students are introduced to the formal process of solving an equation: starting from the assumption that the original equation has a solution. Students explain each step as following from the properties of equality. Students identify equations that have the same solution set.

Opening Exercise (4 minutes)

Opening Exercise

Answer the following questions.

- Why should the equations $(x - 1)(x + 3) = 17 + x$ and $(x - 1)(x + 3) = x + 17$ have the same solution set?
The commutative property.
- Why should the equations $(x - 1)(x + 3) = 17 + x$ and $(x + 3)(x - 1) = 17 + x$ have the same solution set?
The commutative property.
- Do you think the equations $(x - 1)(x + 3) = 17 + x$ and $(x - 1)(x + 3) + 500 = 517 + x$ should have the same solution set? Why?
Yes. 500 was added to both sides.
- Do you think the equations $(x - 1)(x + 3) = 17 + x$ and $3(x - 1)(x + 3) = 51 + 3x$ should have the same solution set? Explain why.
Yes. Both sides were multiplied by 3.

Discussion (4 minutes)

Allow students to attempt to justify their answers for parts (a) and (b) above. Then, summarize with the following:

- We know that the commutative and associative properties hold for all real numbers. We also know that variables are placeholders for real numbers, and the value(s) assigned to a variable that make an equation true is the “solution.” If we apply the commutative and associative properties of real numbers to an expression, we obtain an equivalent expression. Therefore, equations created this way (by applying the commutative and associative properties to one or both expressions) consist of expressions equivalent to those in the original equation.
- In other words, if x is a solution to an equation, then it will also be a solution to any new equation we make by applying the commutative and associative properties to the expression in that equation.
