

Angles of Elevation

An angle of elevation is an angle formed above a horizontal line. We can find and use angles of elevation and trigonometry to measure unusual or difficult distances.

Today we will use a device called an **inclinometer**, made up of a protractor, string and washer. It will help us measure an angle of elevation. Use the picture below to see how an inclinometer is used and answer the following questions.

- 1.) If an angle of elevation is an angle formed above a horizontal line, which is the angle of elevation that we need to measure? _____
- 2.) Which angle will be measured by the inclinometer? _____
- 3.) The string and washer will always hang vertical due to gravity. If YZ is a vertical line and XN is our horizontal line, what can we say about Angle YZX ?
- 4.) If we know angle YZX and our inclinometer measures angle XYZ , how can we find our angle of elevation, angle X ?
- 5.) Our trigonometry functions will allow us to measure the length of MN , if we know at least one angle and one other side length. What distance will we need to measure in order to find the height of the tree?
- 6.) Which trigonometric ratio would you use? Explain.
- 7.) Finally, our trigonometry functions will help us to find the length of segment MN , but this is not the full height of the tree, h . What is the difference between MN and h that will need to be taken into account after finding MN ?
