Figure 1 consists of two diagrams illustrating the connection of a computer to a printer. The left diagram shows a USB cable connecting a computer to a printer. The right diagram shows a parallel cable connecting a computer to a printer.

1. **Identify the problem to be solved.** The first step in the problem-solving process is to identify the problem to be solved. This involves understanding the situation, identifying the goal, and determining the constraints. For example, if the problem is to design a bridge, the goal might be to create a structure that can support a certain weight and span a certain distance, while the constraints might be the available materials and the budget.

2. **Generate possible solutions.** Once the problem is identified, the next step is to generate possible solutions. This involves brainstorming ideas and considering different approaches. For example, in the case of the bridge, one might consider different materials, different designs, or different construction methods.

3. **Evaluate the solutions.** After generating possible solutions, the next step is to evaluate them. This involves comparing the solutions against the goal and constraints, and determining which one is the best. For example, in the case of the bridge, one might compare the different materials based on their strength, weight, and cost, or compare different designs based on their ability to support the required weight and span the required distance.

4. **Implement the solution.** Once the best solution has been identified, the next step is to implement it. This involves putting the solution into practice and monitoring its progress. For example, in the case of the bridge, one might build the bridge and then test it to ensure it can support the required weight and span the required distance.

5. **Reflect on the process.** The final step in the problem-solving process is to reflect on the process. This involves thinking about what worked, what didn't, and what could be learned from the experience. For example, in the case of the bridge, one might reflect on the design process, the construction process, and the testing process, and think about how these could be improved in the future.

1997. *Journal of the American Academy of Child and Adolescent Psychiatry*, 36, 10, 1153-1162.

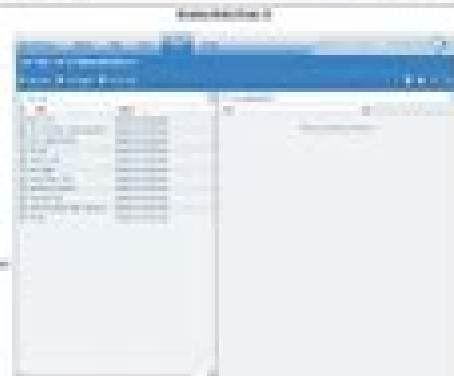

1. **Identify the data type** (nominal, ordinal, interval, ratio).
2. **Choose the appropriate measure of central tendency** (mean, median, mode).
3. **Calculate the measure of central tendency**.
4. **Interpret the result** in the context of the data.
5. **Check for outliers** (values that are significantly higher or lower than the rest of the data).

Example: A teacher wants to know the average score of a class of 30 students on a test. The scores are as follows:

Student	Score
1	85
2	78
3	92
4	88
5	75
6	82
7	90
8	79
9	86
10	77
11	84
12	76
13	91
14	83
15	74
16	87
17	73
18	89
19	72
20	81
21	70
22	80
23	69
24	71
25	68
26	70
27	67
28	69
29	66
30	68

Solution:

1. The data type is **interval** (scores are numerical and have a meaningful order).
2. The appropriate measure of central tendency is the **mean**.
3. The mean score is $\frac{85 + 78 + 92 + 88 + 75 + 82 + 90 + 79 + 86 + 77 + 84 + 76 + 91 + 83 + 74 + 87 + 73 + 89 + 72 + 81 + 70 + 80 + 69 + 71 + 68 + 70 + 67 + 69 + 66 + 68}{30} = 79.33$.
4. The average score of the class is approximately 79.33.
5. There are no outliers in this data set.
