

Social Animal Paper

Dolphins are highly social animals that travel in schools. It makes sense that they would sometimes forage as a cooperative group. Several species have been observed to be group foragers. Some of these species include spotted dolphins, Clymene dolphins, and bottlenose dolphins. The species most associated with group foraging has been the dusky dolphin. Scientists have been trying to determine how many dolphins actually forage in groups, and how they do it. It is hard to concretely determine these, because quite a bit of foraging takes place under water. Scientists are still trying to fully understand how these complex animals work.

Foraging is defined as feeding and all behaviors associated with it (Dugatkin 2014). There are many different theories that researchers have used to show how foraging works. In a study about foraging in groups, researchers Krause and Ruxton found that increasing foraging group size increases the amount of food each forager receives (Dugatkin). This may ... It was observed that dusky dolphins traveled in groups of 6-15 individuals. 20-30 of these small groups may be in a 100 square km area. These small groups suddenly stop moving when a school of fish is seen. Dolphins begin swimming around and underneath the school. They also leap at the sides of the school. Observations show that the group of dolphins herd the fish to the surface so they cannot escape. While the other dolphins maintain the bubble, one individual at a time will break ranks and collect up to five anchovies. They will then join back into the barrier and another dolphin will take its chance to eat. It was also observed that the group of dolphins did not feed for a long time. The average time spent feeding on one group was five minutes. Eventually that school of fish will escape and the group will move on and begin to hunt for some more fish for several
