Binary Decision Diagrams and Extensions for System Reliability Analysis Liudong Xing, Suprasad V. Amari, 2015-06-05 Recent advances in science and technology have made modern computing and engineering systems more powerful and sophisticated than ever. The increasing complexity and scale imply that system reliability problems not only continue to be a challenge but also require more efficient models and solutions. This is the first book systematically covering the state of the art binary decision diagrams and their extended models which can provide efficient and exact solutions to reliability analysis of large and complex systems. The book provides both basic concepts and detailed algorithms for modelling and evaluating reliability of a wide range of complex systems such as multi state systems, phased mission systems, fault tolerant systems with imperfect fault coverage, systems with common cause failures, systems with disjoint failures, and systems with functional dependent failures. These types of systems abound in safety critical or mission critical applications such as aerospace circuits, power systems, medical systems, telecommunication systems, transmission systems, traffic light systems, data storage systems, and etc. The book provides both small scale illustrative examples and large scale benchmark examples to demonstrate broad applications and advantages of different decision diagrams based methods for complex system reliability analysis. Other measures including component importance and failure frequency are also covered. A rich set of references is cited in the book providing helpful resources for readers to pursue further research and study of the topics. The target audience of the book is reliability and safety engineers or researchers. The book can serve as a textbook on system reliability analysis. It can also serve as a tutorial and reference book on decision diagrams, multi state systems, phased mission systems, and imperfect fault coverage models.

Male Sterility in Higher Plants Mohan L.H. Kaul, 2012-12-06 Nature has something more in view than that its own proper males should fecundate each blossom Andrew Knight Philosophical Transactions 1799 Sterility implicating the male sex solely presents a paradoxical situation in which universality and uniqueness are harmoniously blended It maintains a built in outbreeding system but is not an isolating mechanism as male steriles the self emasculated plants outcross with their male fertile sibs normally Both genes nuclear and cytoplasmic and environment individually as well as conjointly induce male sterility the former being genetic and the latter nongenetic Genetic male sterility is controlled either exclusively by nuclear genes ms or by the complementary action of nuclear lr and cytoplasmic c genes The former is termed genic and the latter gene cytoplasmic male sterility

Whereas genic male sterility exhibits Mendelian inheritance gene cytoplasmic male sterility is non Mendelian with specific transmissibility of the maternal cytoplasm type Genetic male sterility is documented in 617 species and species crosses comprising 320 species 162 genera and 43 families Of these genic male sterility occurs in 216 species and 17 species crosses and gene cytoplasmic male sterility in 16 species and 271 species crosses The Predominance of species exhibiting genic male sterility and of species crosses exhibiting gene cytoplasmic male sterility is due to the fact that for the male sterility expression in the former mutation of nuclear genes is required but in the latter mutations of both nuclear and cytoplasmic genes are necessary

*and Important Agronomic Traits Improvement in Non-staple Crops* Meng Kou, Kaixuan Zhang, Jian Sun, Ivan Kreft, 2024-05-15 Non staple crops sometimes known as underutilized semidomesticated orphan and or forgotten crops usually refer to under researched grain and legume compared to staple crops such as sweetpotato buckwheat millet barley pea mung beans and adzuki beans which contain unique and beneficial nutrients that staple crops do not have Combining them with staple foods is an important guarantee for a nutrition balanced diet With the deepening of research the current research on non staple crops has gradually started to create a wide range of materials identify varieties and quality improve yield respond to environmental conditions and regulate growth and development Therefore it is an important research objective to improve the important agronomic traits of non staple crops including anthocyanins in sweetpotato rutin in buckwheat vitamins in millet glucan in barley etc through both cultivation and molecular breeding methods and to create new germplasm resources with high yield and abundant nutrients Recently notable successes have been made using genomic related approaches to uncover the genes responsible for important phenotypes in non staple crops The genetic basis of metabolomic divergence and domestication has been revealed in buckwheat and the QTLs for controlling agronomic traits such as flesh color of sweetpotato have been obtained however the function of related genes still needs further investigation In addition biotic and abiotic stresses in extreme climatic conditions change the yield and quality of crops by affecting the growth and development

of crops and important metabolic regulation processes Non staple crops are often climate resilient and grown in marginal regions with low input conditions including examples for tolerance of drought stress in cowpea and buckwheat tolerance of heat in cassava and tolerance of barren in sweetpotato Investigating the mechanism of their environmental adaptability would provide new insights for breeding of not only non staple crops but also staple crops that are limited in the tolerance of a changing climate to ensure future food security It is of great theoretical significance and practical application value to study the molecular regulatory network of non staple crops under these stress conditions Using cultivation measures plant growth regulators fertilizers and other methods to improve the environmental stress resistance and important agronomic traits in non staple crops Revealing molecular mechanisms and regulatory network under all kinds of environmental stresses in non major crops and improving stress tolerance through genetic engineering Identifying key regulatory genes of important agronomic traits in non staple crops and improving molecular breeding methods
