

In order to produce alternating current at the correct frequency (60 Hz or 50 Hz), the engine must run at the correct speed, which is controlled by the governor. To adjust running speed:

- Run the engine for a few minutes to warm it up thoroughly.
- Connect an electronic or vibrating reed tachometer to the engine according to the manufacturer's instructions.
- With the engine running, turn the speed knob to the "RUN" position.
- Load the generator from 2/3 to full capacity with an electric heater or an incandescent light.
- Turn the cable adjuster nuts, until the engine speed is 3600 rpm for 60 Hz current or 3000 rpm for 50 Hz current. Tighten the nuts.
- As a final check that the generator is operating properly, measure the AC output voltage as described on page 50.

IGNITION

Timing and Point Gap

The ignition system is a magneto incorporated in the flywheel/cooling fan of the engine. The ignition timing is adjusted by changing the contact breaker point gap.

- To adjust the ignition timing, first remove the air cleaner, the control panel, and the muffler cover.

- Loosen the carburetor manifold for clearance, and then remove the spiral case with the pull starter mounted on it.
- Remove the flywheel nut, and then use a flywheel puller to remove the flywheel.

- Remove the point cover.
- Slip the flywheel into place temporarily, and turn the engine to align the "P" mark with the mark on the engine case (KG700B, KG1000B) or on the inner spiral case (KG1500B, KG2600B).

RUNNING SPEED (under load)

	Speed	Load			
		KG700B	KG1000B	KG1500B	KG2600B
60 Hz	3600 rpm	500-750W	730-1100W	1070-1600W	1930-2900W
50 Hz	3000 rpm	430-630W	660-1000W	900-1350W	1660-2500W
