Chapter 43 Active Reading Guide

Global Ecology and Conservation Biology

Overview

In the overview at the beginning of the chapter, the author sets the stage for this final chapter of the book. Let's begin by defining conservation biology.

Section 1

1. Ecologists organize biodiversity on three levels. In the table below, explain the impact of decreasing diversity in each division. Before answering this question, read to page 883, where the topic changes to threats to biodiversity.

Level of Biodiversity	Impact
Genetic Diversity	If one population becomes extinct, then a species may have lost some of the genetic diversity that makes microevolution possible. The erosion of genetic diversity in turn reduces the adaptive potential of the species.
Species Diversity	As more species are lost to extinction, species diversity decreases. Many species that are threatened could potentially provide food, fibers, and medicines for human use, making biodiversity a crucial human resource. Additionally, each loss of a species means the loss of unique genes, some of which may code for enormously useful proteins.
Ecosystem Diversity	There is growing evidence that the functioning of ecosystems, and hence their capacity to perform services, is linked to biodiversity. As human activities reduce biodiversity, we are reducing the capacity of the planet's ecosystems to perform processes critical to our own survival.

2. Explain the difference between endangered species and threatened species. An endangered species is one that is in danger of extinction throughout all or a significant portion of its range. A threatened species is one that is considered likely to become

Nutritional Oncology George L. Blackburn, Vay Liang W. Go, John Milner, 2011-05-02 Nutritional oncology is an increasingly active interdisciplinary field where cancer is investigated as both a systemic and local disease originating with the changes in the genome and progressing through a multi step process which may be influenced at many points in its natural history by nutritional factors that could impact the prevention of cancer the quality of life of cancer patients and the risk of cancer recurrence in the rapidly increasing population of cancer survivors Since the first edition of this book was published in 1999 the idea that there is a single gene pathway or single drug will provide a cure for cancer has given way to the general view that dietary environmental factors impact the progression of genetic and cellular changes in common forms of cancer This broad concept can now be investigated within a basic and clinical research context for specific types of cancer This book attempts to cover the current available knowledge in this new field of nutritional oncology written by invited experts This book attempts to provide not only the theoretical and research basis for nutritional oncology but will offer the medical oncologist and other members of multidisciplinary groups treating cancer patients practical information on nutrition assessment and nutritional regimens including micronutrient and phytochemical supplementation The editors hope that this volume will stimulate increased research education and patient application of the principles of nutritional oncology NEW TO THIS EDITION Covers hot new topics of nutrigenomics and nutrigenetics in cancer cell growth Includes new chapters on metabolic networks in cancer cell growth nutrigenetics and nutrigenomics Presents substantially revised chapters on breast cancer and nutrition prostate cancer and nutrition and colon cancer and nutrition Includes new illustrations throughout the text especially in the breast cancer chapter Includes integrated insights into the unanswered questions and clearly defined objectives of research in nutritional oncology Offers practical guidelines for clinicians advising malnourished cancer patients and cancer survivors on diet nutrition and lifestyle Provides information on the role of bioactive substances dietary supplements phytochemicals and botanicals in cancer prevention and treatment *Evolution of the Insects* David Grimaldi, Michael S. Engel, 2005-05-16 Insects are the most diverse group of organisms in the 3 billion year history of life on Earth and the most ecologically dominant animals on land This book chronicles for the first time the complete evolutionary history of insects their living diversity relationships and 400 million years of fossils Whereas other volumes have focused on either living species or fossils this is the first comprehensive synthesis of all aspects of insect evolution The book is illustrated with 955 photo and electronmicrographs drawings diagrams and field photos many in full colour and virtually all of them original The book will appeal to anyone engaged with insect diversity professional entomologists and students insect and fossil collectors and naturalists **Evolution's Wedge** David Pfennig, Karin Pfennig, 2012-10-25 Evolutionary biology has

long sought to explain how new traits and new species arise Darwin maintained that competition is key to understanding this biodiversity and held that selection acting to minimize competition causes competitors to become increasingly different thereby promoting new traits and new species Despite Darwin's emphasis competition's role in diversification remains controversial and largely underappreciated In their synthetic and provocative book evolutionary ecologists David and Karin Pfennig explore competition's role in generating and maintaining biodiversity The authors discuss how selection can lessen resource competition or costly reproductive interactions by promoting trait evolution through a process known as character displacement They further describe character displacement's underlying genetic and developmental mechanisms The authors then consider character displacement's myriad downstream effects ranging from shaping ecological communities to promoting new traits and new species and even fueling large scale evolutionary trends Drawing on numerous studies from natural populations and written for a broad audience *Evolution's Wedge* seeks to inspire future research into character displacement's many implications for ecology and evolution
