A Systems Biology Approach to Blood Seth Joel Corey, Marek Kimmel, Joshua N. Leonard, 2014-12-06 The blood system is multi scale from the organism to the organs to cells to intracellular signaling pathways to macromolecule interactions Blood consists of circulating cells cellular fragments platelets and microparticles and plasma macromolecules Blood cells and their fragments result from a highly ordered process hematopoiesis Definitive hematopoiesis occurs in the bone marrow where pluripotential stem cells give rise to multiple lineages of highly specialized cells Highly productive and continuously regenerative hematopoiesis requires a microenvironment of mesenchymal cells and blood vessels A Systems Biology Approach to Blood is divided into three main sections basic components physiological processes and clinical applications Using blood as a window one can study health and disease through this unique tool box with reactive biological fluids that mirrors the prevailing hemodynamics of the vessel walls and the various blood cell types Many blood diseases rare and common can and have been exploited using systems biology approaches with successful results and therefore ideal models for systems medicine More importantly hematopoiesis offers one of the best studied systems with insight into stem cell biology cellular interaction development lineage programing and reprograming that are every day influenced by the most mature and understood regulatory networks

Hematopoietic Stem Cell Biology Motonari Kondo, 2009-12-04 In the summer of 1988 my developmental biology professor announced to the class that hematopoietic stem cells HSCs had finally been purified Somehow I never forgot the professor s words When I started working in Dr Irv Weissman s labo tory at Stanford as a postdoctoral fellow I realized that the findings mentioned by the professor were from Weissman s laboratory and had been published in a 1988 edition of the journal Science It has been over 20 years since the publication of that seminal paper and since then tremendous advances in understanding the biology and maturation of HSCs namely the process of hematopoiesis which includes lymphocyte development have been made These discoveries were made possible in part by advancements in technology For example recent availability of user friendly fluorescence activated cell sorting FACS machines and monoclonal antibodies with a variety of fluorescent labels has allowed more scientists to sort and analyze rare populations in the bone marrow such as HSCs All classes of hematopoietic cells are derived from HSCs Stem cell biology draws enormous attention not only from scientists but also from ordinary people because of the tremendous potential for development of new therapeutic application to diseases that currently lack any type of effective therapy Thus this type of regenerative medicine is a relatively new and attractive field in both basic science and clinical medicine
