We evaluated the ability of the Neurobehavioral Cognitive Status Examination (NCSE) to accurately distinguish between healthy older adults and geriatric patients suffering from dementia. Although the NCSE correctly identified all dementia patients, it produced an unacceptably high rate of false positives among the healthy elderly (70%). Despite the NCSE's lack of specificity when using the recommended classification criteria, significant group differences were found on several individual subscales and on the total number of subscales passed. These findings suggest the need to further evaluate the appropriateness of the geriatric norms for the NCSE and highlight some of the unique considerations involved in the assessment of older adults. © 1997 National Academy of Neuropsychology

Clinical neuropsychologists are poised to play a pivotal role in the care and treatment of the ever-increasing geriatric segment of the population through the process of ongoing cognitive assessment and functional evaluation. More than ever before, geriatric care facilities are regularly faced with the need to obtain neuropsychological evaluation of their residents for purposes that include differential diagnosis, placement, and an assessment of needs regarding nursing requirements and level of general care. The demand for sensitive cognitive screening measures that can be employed in an expedient, valid fashion is reinforced by the realization that the elderly are particularly susceptible to potentially reversible causes of cognitive impairment related to such etiologies as depression and a sensitivity to the effects of medication.

Several widely used screening instruments for use with older adults suffer from a lack of sensitivity and an inability to provide more than a dichotomous classification of patients as either cognitively impaired or non-impaired (Osato, Yang, & La Rue, 1993). The Neurobe-
