Coral Reef Remote Sensing James A. Goodman, Samuel J. Purkis, Stuart R. Phinn, 2013-04-18 Remote sensing stands as the defining technology in our ability to monitor coral reefs as well as their biophysical properties and associated processes at regional to global scales With overwhelming evidence that much of Earth's reefs are in decline our need for large scale repeatable assessments of reefs has never been so great Fortunately the last two decades have seen a rapid expansion in the ability for remote sensing to map and monitor the coral reef ecosystem its overlying water column and surrounding environment Remote sensing is now a fundamental tool for the mapping monitoring and management of coral reef ecosystems Remote sensing offers repeatable quantitative assessments of habitat and environmental characteristics over spatially extensive areas As the multi disciplinary field of coral reef remote sensing continues to mature results demonstrate that the techniques and capabilities continue to improve New developments allow reef assessments and mapping to be performed with higher accuracy across greater spatial areas and with greater temporal frequency The increased level of information that remote sensing now makes available also allows more complex scientific questions to be addressed As defined for this book remote sensing includes the vast array of geospatial data collected from land water ship airborne and satellite platforms The book is organized by technology including visible and infrared sensing using photographic multispectral and hyperspectral instruments active sensing using light detection and ranging LiDAR acoustic sensing using ship autonomous underwater vehicle AUV and in water platforms and thermal and radar instruments **Emphasis and Audience** This book serves multiple roles It offers an overview of the current state of the art technologies for reef mapping provides detailed technical information for coral reef remote sensing specialists imparts insight on the scientific questions that can be tackled using this technology and also includes a foundation for those new to reef remote sensing The individual sections of the book include introductory overviews of four main types of remotely sensed data used to study coral reefs followed by specific examples demonstrating practical applications of the different technologies being discussed Guidelines for selecting the most appropriate sensor for particular applications are provided including an overview of how to utilize remote sensing data as an effective tool in science and management The text is richly illustrated with examples of each sensing technology applied to a range of scientific monitoring and management questions in reefs around the world As such the book is broadly accessible to a general audience as well as students managers remote sensing specialists and anyone else working with coral reef ecosystems

The fast exchange of information and knowledge are the essential conditions for successful and effective research and practical applications in cartography. For successful research development it is necessary to follow trends not only in this domain but also try to adapt new trends and technologies from other areas. Trends in cartography are also quite often topics of many conferences which have the main aim to link research education and application experts in cartography and GIS. This is the right place for exchange and sharing of knowledge and skills. This was also the CARTOCON2014 conference which took place in Olomouc, Czech Republic in February 2014 and this book is a compilation of the best and most interesting contributions. The book content consists of four parts. The first part, 'New approaches in map and atlas making', collects studies about innovative ways in map production and atlases compilation. The following part of the book, 'Progress in web cartography', brings examples and tools for web map presentation. The third part, 'Advanced methods in map use', includes achievement of eye tracking research and users' issues. The final part, 'Cartography in practice and research', is a clear evidence that cartography and maps played the significant role in many geosciences and in many branches of the society. Each individual paper is original and has its place in cartography.

Applications and Challenges of Geospatial

Managing Basin Interdependencies in a Heterogeneous, Highly Utilized and Data Scarce River Basin in Semi-Arid Africa Jeremiah Kipkulei Kiptala, 2020-04-30 For integrated water resources management both blue and green water resources in a river basin and their spatial and temporal distribution have to be considered This is because green and blue water uses are interdependent In sub Saharan Africa the upper landscapes are often dominated by rainfed and supplementary irrigated agriculture that rely on green water resources Downstream most blue water uses are confined to the river channels mainly for hydropower and the environment Over time and due to population growth and increased demands for food and energy water use of both green and blue water has increased This book provides a quantitative assessment of green blue water use and their interactions The book makes a novel contribution by developing a hydrological model that can quantify not only

green but also blue water use by many smallholder farmers scattered throughout the landscape The book provides an innovative framework for mapping ecological productivity where gross returns from water consumed in agricultural and natural vegetation are quantified The book provides a multi objective optimization analysis involving green and blue water users including the environment The book also assesses the uncertainty levels of using remote sensing data in water resource management at river basin scale
