As more and more governments and private companies rely on Internet and Communications Technology (ICT), maintaining information security is becoming of utmost importance. In the pursuit of preventing cyberattacks, many entities have long been embarking on up-to-date technologies and software programs. Governments and commercial organizations have started considering human factors such as user role, knowledge, learning style, and psychological factors in implementing information awareness programs.

Until recently, businesses have relied solely on the process and technologies to address cybersecurity threats without incorporating human factors into their plan. After continuous attacks, companies realized the importance of considering employees' integration with the processes and technologies in effectively addressing security threats (Ki-Aries & Faily, 2017). Integrating workers into security prevention is through implementing information security awareness (ISA) programs. Such programs aim to improve workers' perception of the cyber security risk as credible and teach how to prevent risks (Bada et al., 2019). Hence, ISA aims to teach people to be aware of the potential cyber threats and respond accordingly.

Impact of User Characteristics on Security Awareness and Learning

Prior Knowledge

Another significant human factor impacting individuals' engagement with security awareness (IS) is their general knowledge about IS. Empirical evidence shows that "higher the user's knowledge of fundamental IS applications, the more likely they are aware of security-related issues" (Jaeger, 2018, p. 4705). On the contrary, those who lack knowledge in IS are reluctant to engage in cybersecurity awareness training (Jaeger, 2018). Hence, users' prior knowledge in security awareness-related issues can substantially impact their awareness level and learning.
