Writing Your Biology Research Papers

A key component of this course is writing two research papers. This will give you the opportunity to apply what you are learning about Biology to your own life. Each paper will make up 10 percent of your grade. The following information will serve as a guideline in helping you construct your paper for this course. Pay special attention to the paper requirements, tips, and evaluation sections. The tips are important because they will explain how to go about writing a successful paper.

You will want to refer back to this topic periodically as you write your paper to make sure you are meeting the research paper guidelines.

Part 1 Research Paper Topics

Topics

For this course, you will have two pre-selected topics to choose from for each research paper you write. For the Part 1 Research Paper, you will choose from topics that are specifically geared to the information you are learning in Part 1 of the course; for the Part 2 Research Paper, you will choose one of the topics that are specifically geared to the information you are learning in Part 2 of the course.

Topic 1:

Cancer is a class of diseases characterized by an uncontrolled growth of cells in the human body. There are many different types of cancers, and cancer may affect people of all ages. Compose a research paper that investigates and reports on the biological and environmental aspects of cancer. Use library resources and the Internet to conduct your research. Your paper should address, but not be limited to, the following questions and concepts:

- Discuss the structure of cancer at the cellular level.
- What happens to the cells that can trigger cancer to develop?
- How does cancer spread?
- What are some common cancer risk factors and what types of cancer could they lead to? Include three or more.
- Why are cancer-causing factors in lifestyle or the environment difficult to identify?
- How can people protect themselves from exposure to known risk factors?
- Research and report on current findings related to the benefits of exercise as a treatment for cancer.

Paradise, A. Malcolm Campbell, 2016-04-27 Organisms maintain homeostasis in a variety of ways In the first part of this book mammals are shown to regulate their body temperatures through homeostatic mechanisms The data from thermoregulation experiments that demonstrated the role of neurons in body temperature homeostasis are examined The second part of this book discusses how

organisms allocate the limited energy that is available to them for survival growth or reproduction Excess energy in individuals can translate to growth of populations if enough remains after survival and growth it can be allocated to reproduction However even closely related organisms may have different strategies for allocating resources that are dependent upon the environmental conditions in which they exist Evolution in Action Matthias Glaubrecht,2010-07-24

Radiations or Evolution in Action We have just celebrated the Darwin Year with the double anniversary of his 200th birthday and 150th year of his masterpiece On the Origin of Species by means of Natural Selection In this work Darwin established the factual evidence of biological evolution that species change over time and that new organisms arise by the splitting of ancestral forms into two or more descendant species However above all Darwin provided the mechanisms by arguing convincingly that it is by natural selection as well as by sexual selection as he later added that organisms adapt to their environment The many discoveries since then have essentially confirmed and strengthened Darwin's central theses with latest evidence for example from molecular genetics revealing the evolutionary relationships of all life forms through one shared history of descent from a common ancestor We have also come a long way to progressively understand more on how new species actually originate i.e. on speciation which remained Darwin's mystery of mysteries as noted in one of his earliest transmutation notebooks Since speciation is the underlying mechanism for radiations it is the ultimate causation for the biological diversity of life that surrounds us *Advanced Statistical Methods in Life Science* Basavarajaiah D.M,Narasimhamurthy B,2025-07-25

This book introduces the principles and foundations of advanced statistical methods for designing experiments and testing hypotheses in life sciences Advanced statistical methods such as testing of hypotheses recent methods of sample size determination imputation estimation techniques probability distributions and univariate analysis demonstrated with real data and their integration into life sciences are included in this book Advanced topics are presented with sufficient conceptual depth and examples to explain the use of recent statistical techniques and to demonstrate what conclusions can be drawn at the right time using modeling in life science research Key features Explains the derivation of statistical models to prove disease transmission using massive real world datasets to explore practical applicability Incorporates the application of innovative advanced statistical and epidemiological models and demonstrates the possible solutions for public health policy intervention Helps to understand the process of hypothesis testing in small or larger observations by using weighted parameters Presents suitable examples and real life research datasets and all models can easily be followed in formulating statistical and mathematical derivations and key points Includes machine learning ML statistical methods for meta analysis testing of hypotheses methods of imputation estimation techniques probability distributions univariate analysis and recent nonparametric methods all illustrated through actual data This textbook is for students and scholars of various courses in life sciences medicine mathematics and statistical science It will also help academicians and researchers to understand the foundation of this topic *Biology at the Single Molecule Level* S.H.

Leuba,J. Zlatanova,2001-12-17 This is the first book solely devoted to single molecule biochemistry and molecular biology Authors were selected on the basis of their contribution to this new and exciting field and were asked to focus more on the biological problems that can be approached using single molecule techniques rather than on the techniques per se It is thought that such techniques will eventually dominate the physical characterization of biologically important macromolecules

Investigative Biology ,1986 Undergraduate Mathematics for the Life Sciences Glenn Ledder,Jenna P.

Carpenter,Timothy D. Comar,2013 There is a gap between the extensive mathematics background that is beneficial to biologists and the minimal mathematics background biology students acquire in their courses The result is an undergraduate education in biology with very little quantitative content New mathematics courses must be devised with the needs of biology students in mind In this volume authors from a variety of institutions address some of the problems involved in reforming mathematics curricula for biology students The problems are sorted into three themes Models Processes and Directions It is difficult for mathematicians to generate curriculum ideas for the training of biologists so a number of the curriculum models that have been introduced at various institutions comprise the Models section Processes deals with taking that great course and making sure it is institutionalized in both the biology department as a requirement and in the mathematics department as a course that will live on even if the creator of the course is no longer on the faculty Directions looks to the future with each paper laying out a case for pedagogical developments that the authors would like to see
