by chemically synthesising the DNA new DNA may be created Recombinant DNA methods can be found here In most cases a construct is built and then used for the purpose of inserting this DNA into the host organism Paul Berg created the first recombinant DNA molecule in 1972 by mixing the DNA of two different viruses namely SV40 from monkeys and lambda from lambda viruses The method may also be used to delete genes often known as knocking out genes in addition to introducing new genes It is possible to insert the new DNA in a random pattern or it may be targeted to a particular region of the genome
