- ii. **Genetics** is the study of inherited traits, and their patterns, **genes** and **traits** and heredity. They fall into three broad hereditary categories:
- **Genes** are made up of DNA (Deoxyribonucleic Acid).
 - A **trait** is any characteristic that an organism displays. Traits are produced by an interaction between genetic and environmental influences.
 - The **genome** is the complete set of genetic instructions (including all an organism's **chromosomes**) a biological systems' total complement of inheritable instructions.
 - Only 1-2% of our DNA encodes proteins.
 - 98-99% of the genome contains DNA sequences that are either: repeating features that don't encode proteins.
 - 98-99% of the genome contains DNA sequences that regulate expression of proteins.
 - For a gene that encodes a sequence, a mutation must occur in that gene's sequence in the DNA.
 - For a gene that encodes a sequence, a mutation must occur in that gene's sequence and then must be passed from parent to offspring.
 - The genome contains many repetitive DNA sequences that do not encode proteins found in the genome.
 - Chromosomes hold all (very) important genes and associated proteins.
 - Similar genome structures exist.
 - All cells in body contain the genome.
 - Every genome contains an "easel" for copying and making proteins.
- iii. **Expression of genes**
- protein sequence of a protein-coding feature
 - protein sequence of a non-coding protein
 - DNA sequence in the genome of a human cell contains a regulatory site for a regulatory feature that can cause that site being expressed or a trait or phenotype.
