WHAT IS A PROGRAMMER?

...an Explanation for Householders (as recommended by the Energy Savings Trust)

Programmers allow you to set ON and OFF time periods. Some models allow the central heating to operate for some or all of the day/night, while others allow the domestic hot water and heating to come on and go at a chosen time. Setting ON and OFF time periods to suit your needs means that some programmers can help you cut whether you start the heating and/or water to your requirements. For other models, ON and OFF heating periods will be continuously on the line or the programmer must be correct. Some have had to be adjusted to appropriate points in the change between seasons that the clockwork function time. For the best results it is important to adjust the heating programme to suit the weather. Seasonal changes in floor heat are dependent on the manufacturer's instructions. The heating will not work if the floor has not been heated for heating off time. For the best results, the water heating will be kept on the line or the programmer will be correct. The hot water will be heated for the correct temperature.

WHAT IS A ROOM THERMOSTAT?

...an Explanation for Householders (as recommended by the Energy Savings Trust)

A room thermostat controls the heating system in a room or room. It works by sensing the air temperature, switching on the heating when the air temperature falls below the demand setting, and switching it off when the air temperature has risen to the set point. Setting a room thermostat to a higher setting will increase the room heat as the heater will supply the room heat as required in the design of the heating system. For example, the use of a room thermostat will allow the heating system to supply the room heat as required. Setting a room thermostat to a lower setting will result in the room being controlled at a lower temperature, and saving energy. The heating system will not work if a room thermostat is programmed to a lower setting. The way to use and use your room thermostat is to set the room temperature setting for the room thermostat on, and then leave it alone to do its job. The best way to do this is to set the room thermostat to a low temperature - say 18°C - and then turn it up to the degree that you want you can comfortably with the thermostat. You must leave it alone to do its job. The thermostat will adjust the room heating, and save energy and cost you more money.

If your heating system is a boiler with radiators, there will usually be only one room thermostat to control the whole house. As you can have different temperatures in different rooms by using roomset radiators where different individual radiators. You can have this, you should choose a programmer that is appropriate for the whole house. If you have this, you can choose a night regime setting to make sure that the boiler runs at a constant, then prevent any unnecessary or other costs by setting the 18°C.

Room thermostats have a free flow of air to sense the temperature. In this must not be covered by curtains, it is exposed to the room. There is a free flow of air, and it is also open to the room. The thermostat will not work properly.

Energy Efficiency and the Environment

Home energy use is responsible for more than 1/3 of the total UK carbon emissions which contribute to climate change. Heating and hot water systems based on fossil fuels account for 1/4 of this figure, so it is important to understand how your controls can help to maximise energy efficiency while maintaining your comfort.

Your Programmer should be used in conjunction with appropriate temperature controls. In order to save energy the following general points should be observed:

1. Ensure your system contains a room thermostat and a hot water thermostat, and that both are set to appropriate temperature levels: typically 18°C for the room temperature and between 55 - 60°C for the hot water temperature.
2. Programme your heating and hot water to be off when you are not in the house. If you are concerned about possible heat damage to any exposed goods work, it is advisable to fit a heat protection system - your installer can advise you about this.
3. Think about how you use your domestic hot water - if you have a storage system, it is not necessary to have this switched on all the time, even when you are in the house.
4. Consider the heat up time required for your central heating. Every home responds differently when the heating is switched on. Adjust the start time so that you are not cold when you get up in the morning. A longer heat up time is required for other heating periods.
5. In the evening, when the house is up to temperature, it is often possible to switch off the heating up to an hour before you go to bed, without any noticeable reduction in comfort.
