

The Digestive System

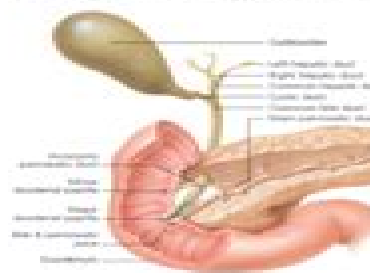

What is the digestive system?

The digestive system, or **gastrointestinal tract**, is a tract of organs that is responsible for digesting and absorbing nutrients from food. Food is broken down mechanically in the mouth, is digested through a series of chemical reactions, and absorbed into the bloodstream. The nutrients are then used by the body for energy and growth. The waste is eliminated from the body through the excretory system.

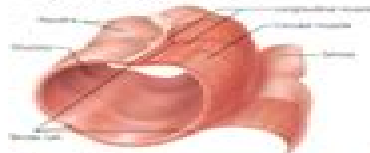

Liver, pancreas & gallbladder

After leaving the stomach, chyme moves into the duodenum, the first part of the small intestine, where it is mixed with bile secreted by the **liver** and pancreatic juice secreted by the **pancreas**. This acts as a strong agent on the chyme, while the duodenum's mucous membrane secretes digestive enzymes further. Bile, from the liver, emulsifies fat, breaking it down into small droplets in the **gallbladder**.

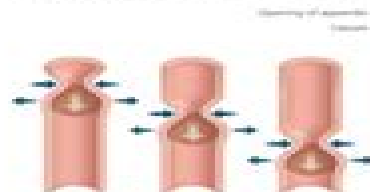

Layers of large intestine

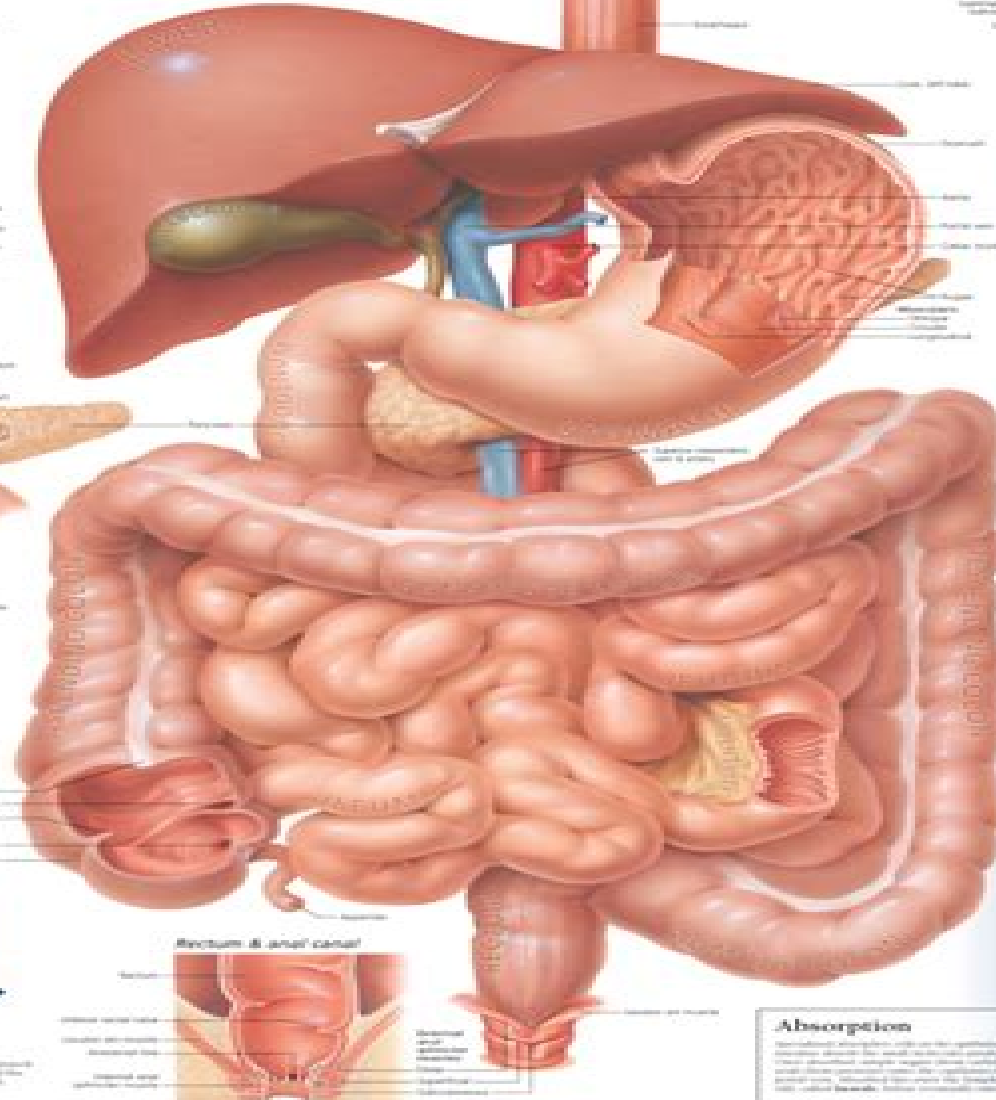

Large intestine

The large intestine consists of the cecum, the caecum, the ascending colon, the transverse colon, the descending colon, the sigmoid colon, and the rectum. The large intestine is responsible for absorbing water and electrolytes from the chyme, and for storing and eliminating waste.

Peristaltic action

Food material is pushed through the digestive system by a series of powerful muscular contractions called peristalsis. These contractions move the material forward and the food is then, when the stomach has relaxed.

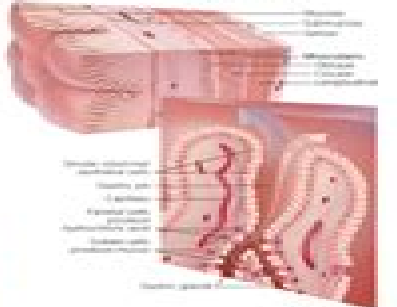

The mouth & salivary glands

Chewing the food breaks it into smaller pieces, making it easier to swallow. Saliva, secreted by the salivary glands, moistens the food and helps in the digestion of carbohydrates. Saliva also contains the enzyme amylase, which begins the breakdown of starches into sugars. The food is then swallowed and moves down the esophagus to the stomach.

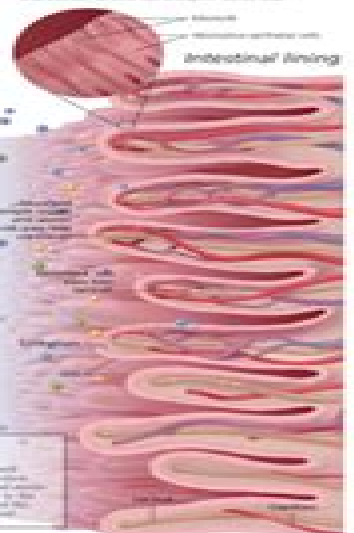

The stomach

The stomach is a large, muscular organ that is responsible for storing and mixing food with gastric juices. The stomach is divided into two main parts: the **fundus** (upper part) and the **pylorus** (lower part). The pylorus is responsible for regulating the passage of food into the small intestine.

Small intestine

The small intestine consists of three parts: the **duodenum**, the **jejunum**, and the **ileum**. The duodenum is the first part of the small intestine, where it receives chyme from the stomach. The jejunum and ileum are responsible for the majority of the digestion and absorption of nutrients.

Absorption

The nutrients are absorbed into the bloodstream through the walls of the small intestine. The villi, which are finger-like projections of the intestinal lining, increase the surface area for absorption. The nutrients are then transported to the liver through the portal vein.
