PROCEDURE

1. Measure the CO_2 uptake and transpiration (E) of a plant in a potometer. It is found that the CO_2 uptake is 100 units per hour.
2. The stomata are closed and light is given to the potometer. It is found that the CO_2 uptake is 20 units per hour.
3. Repeat the above steps after opening the stomata. It is found that the CO_2 uptake is 100 units per hour.
4. It is found that the transpiration rate is 100 units per hour when the stomata are open.

CONCLUSION

the maximum amount of light available to the plant. In addition to different rates of growth the results showed that red and blue light were most effective in terms of growth promotion. There was more growth with green and white light than with blue light and more growth with red and white than green light. The degree of yellow light in red light is important, and with this light alone, more growth is caused than by blue light, it is suggested. In blue stimulating under light, the effect of the degree of blue light was also investigated and shown that the green and blue light caused the most increase in growth rate of *Salvinella* with different plant strains under white light. The finding seems to indicate that, in order to make better growing, the blue light source is important. The finding shows that green light is very important in order to make blue light to working harmoniously with other colors of light.

FUTURE CONSIDERATION

My latest thought about this ground was to add forest again, but the figures about global carbon sinks are close to zero, not questioned by ecologists as I suspected. And it had also come long before the idea was already taking the movement by a storm (see page 10).
