Griffiths,2006-12-08   On Complexity Certification of Active-Set QP Methods with Applications to Linear MPC Daniel Arnström,2021-03-03 In model predictive control MPC an optimization problem has to be solved at each time step which in real time applications makes it important to solve these efficiently and to have good upper bounds on worst case solution time Often for linear MPC problems the optimization problem in question is a quadratic program QP that depends on parameters such as system states and reference signals A popular class of methods for solving such QPs is active set methods where a sequence of linear systems of equations is solved The primary contribution of this thesis is a method which determines which sequence of subproblems a popular class of such active set algorithms need to solve for every possible QP instance that might arise from a given linear MPC problem i e for every possible state and reference signal By knowing these sequences worst case bounds on how many iterations floating point operations and ultimately the maximum solution time these active set algorithms require to compute a solution can be determined which is of importance when e g linear MPC is used in safety critical applications After establishing this complexity certification method its applicability is extended by showing how it can be used indirectly to certify the complexity of another efficient type of active set QP algorithm which reformulates the QP as a nonnegative least squares method Finally the proposed complexity certification method is extended further to situations when enhancements to the active set algorithms are used namely when they are terminated early to save computations and when outer proximal point iterations are performed to improve numerical stability   **Constructing Scalar-Valued Objective Functions** Andranik Tangian,Josef Gruber,2012-12-06 For several decades scholars have developed methods for solving optimization problems which emerge in economics econometrics operations research and other disciplines A considerable effort has been made to construct equations from which constraints can be derived but surprisingly little has been done to construct the other part of optimization models the scalar valued objective function the constrained maximum or minimum of which gives the optimal solution The given volume is intended to attract attention to the problem to present the major achievements in the field and to stimulate further research and teaching   **Working with Dynamic Crop Models** Daniel Wallach,David Makowski,James W. Jones,Francois Brun,2006-05-10 Mathematical models are being used more and more widely to study complex dynamic systems global weather ecological systems hydrological systems nuclear reactors etc including the specific subject of this book crop soil systems The models are important aids in understanding predicting and managing these systems Such models are complex and imperfect One fundamental research direction is to seek a better understanding of how these systems function and to propose mathematical expressions embodying that understanding However this is not sufficient It is also essential to have tools often mathematical and statistical methods to aid in developing improving and using the models built from those equations The book is specifically concerned with the application of methods to crop models but much of the material is also applicable to dynamic system models in other fields The goal of this book is to fill that gap State of the art methods explained simply and illustrated

specifically for crop models Parameter estimation applying statistical methods to the complex case of crop models including Bayesian methods Includes model evaluation understanding and estimating prediction error Offers a unique data assimilation by using the Kalman filter and beyond **Experiment and Evaluation in Information Retrieval Models** K.
