reactive chemicals and materials posing fire and explosion hazards The volume has been written for chemical handling specialists first responders to hazardous materials incidents and firefighters The basic definition used for a hazard materials incident is any situation that may potentially lead to catastrophic fire or explosion and or human exposed to a toxic chemical This situation may result from a spill of a hazardous material a leak from a storage vessel or shipping container or the mixing of incompatible chemicals whereby a chemical reaction could occur resulting in the release of energy and generation of toxic and perhaps flammable by products The volume provides chemical specific information providing the reader with rigorous information on the chemical of interest This book is a compendium of chemical specific fire and chemical reactivity data and information More than 1 000 chemicals have been researched and organized into a reference handbook for fire specialists chemical handling specialists and plant safety engineers The specific information provided for chemicals includes the flammability characteristics recommended fire extinguishing practices fire extinguishing agents not to be used behavior in fires burning characteristics chemical reactivity with regard to water and common materials incompatible chemical mixtures containment and neutralization methods for spills This reference book has been designed as a data bank for the hazardous materials handling specialist and industrial safety managers dealing with large chemical inventories It is intended to be used by fire and loss prevention specialists and as a basis for developing procedures for safe storing and handling of chemicals The authors have included an extensive physical properties section on chemicals with information most pertinent to fire response situations

Preservation of Surfactant Formulations F. Morpeth,2012-12-06 Microbes are known to live in an enormous range of environments Their ability to survive and proliferate in diverse industrial systems is often a surprise to those not exposed to these problems in their work These systems contain a range of potential carbon sources one common theme being surfactants Surfactants are often not the components most prone to spoilage since some systems contain highly susceptible natural components such as starch and xanthum gum but the surfactant is a key part of the formulation and its extensive breakdown usually means that the material is beyond recovery The aim of this book is to describe in detail all aspects of the preservation of surfactant containing materials The book should be viewed as being in three discrete sections chapters 1 5 deal with and summarise essential background information chapters 6 11 discuss in detail various end use applications chapters 12 15 outline the regulatory and toxicology implication associated with the safe handling of preservatives Given the format of the book there is inevitably some duplication of information in the middle section with different authors describing

essentially the same phenomena but on different substrates I hope the reader will find that although different chapters touch on the same topics the information around these areas is sufficiently different to justify their inclusion in this book and to be of interest It should also demonstrate what can be the most useful source of information the hard practical experience of the authors
