Zhenghong Yu, Huabing Zhou, Luca Iocchi, Jeffrey Too Chuan Tan, Changcai Yang, Hao Lu, 2025-01-10 Population growth and climate change have posed significant challenges to crop breeding The identification of crop agronomic traits is fundamental to breeding yet currently the collection of such traits is largely reliant on the subjective judgment of workers or ground test equipment which is both costly and inefficient In recent years the advancement of artificial intelligence AI has revolutionized modern agriculture and plant science AI is a rapidly evolving field with datasets models and algorithms constantly changing It has also been increasingly applied to unmanned aerial vehicles field robots and hyperspectral imaging sensors offering great potential for large scale crop growth monitoring and precision management driving the agricultural field from mechanization to automation and intelligence This research topic aims to encourage research work that actively embraces new AI ideas progress and combines these new ideas technologies with robotics or sensing technologies for applications in plant phenotyping or precision agriculture We encourage the use of technologies that have seen significant development in the AI community after 2020 such as vision transformers and diffusion models
