The Molecular Pathology of Cognitive Decline: Focus on Metals Paul A. Adlard, Roger Chung, 2016-02-02 In the past two decades there have been significant advances made in understanding the cellular and molecular alterations that occur with brain ageing as well as with our understanding of age related brain diseases Ageing is associated with a mid life decline in many cognitive domains eg Attention working memory episodic memory that progresses with advancing age and which may be potentiated by a variety of diseases However despite the breadth of attempts to explain it the underlying basis for age related memory impairment remains poorly understood Both normal and pathological ageing as in age related neurodegenerative disorders such as Alzheimer's disease may be associated with overlapping and increased levels of abnormal pathology and this may be a potential mediator of cognitive decline in both populations An emerging hypothesis in this field is that metal ion dys homeostasis may represent a primary unifying mechanism to explain age and disease associated memory impairment either indirectly via an effect on disease pathogenesis or by a direct effect on signaling pathways relevant to learning and memory There remains a concerted worldwide effort to deliver an effective therapeutic treatment for cognitive decline associated with ageing and or disease which is currently an unmet need There have been numerous clinical trials conducted specifically testing drugs to prevent cognitive decline and progression to dementia but to date the results have been less than impressive highlighting the urgent need for a greater understanding of the neurobiological basis of memory impairment in ageing and disease which can then drive the search for effective therapeutics

About Life Paul S. Agutter, Denys N. Wheatley, 2007-03-06 Thanks to the popular media and to books by Dawkins Fortey Gould Margulis and other writers people are informed about many aspects of biology Everyone seems to know a little about evolution for example and about DNA and the possibilities good and bad afforded by research in molecular genetics Most people know some of the arguments for and against the likelihood of life on other planets And so on We are glad that these pieces of information have become so widely available However we do not assume any particular knowledge other than the most basic in this book Our aim is to address general questions rather than specific issues We want to enable our readers to join their disparate pieces of knowledge about biology together The most basic of these general questions and perhaps the most difficult can be expressed in beguilingly simple words What is life What does modern biology tell us about the essential differences between living organisms and the inanimate world An attempt to answer this question takes us on a journey through almost the whole of contemporary cell and molecular biology which occupies the first half of the book The journey is worth the effort The provisional answer we attain provides a coherent unifying context in which we can discuss evolution the origin of life extraterrestrial life the meaning of intelligence the evolution of the human brain and the nature of mind
