

Homeostasis (pp. 72-83)

Organisms develop internal mechanisms, often hormonally-mediated, to maintain relatively constant internal conditions.

A regulated variable must be maintained within a normal range of values, relative to set point, or normal range/baseline.

List 4 examples of regulated variables (body/blood levels):

- 1) Temperature
- 2) Blood glucose and composition of body fluids
- 3) Mineral Ions (electrolytes)
- 4) Blood Pressure

Homeostasis is described as a state of homeostatic balance.

Homeostasis is a negative feedback mechanism.

Regulated variable is restored back regulated variable within a normal range by reversing

any variation (disturbance) that the variable is in. It occurs via opposing responses that reverse.

Regulated variable is restored after disturbance: return homeostasis and variable.

A variable increases or decreases the body's temperature or glucose level, the control system then adjusts variable to the normal range.

In the body, reversal mechanisms constantly maintain body composition and avoid signals for a specific homeostatic response. If any disturbance occurs, reversal signals

growth or a cell or tissue that body composition within the disturbance is then the cell/growth

response response are an opposite response the response of the body's homeostatic response.

Regulated variable homeostatic response and then body return to homeostatic

reversing the response.
