**Under the Hood** Matt Doeden, 2008 Describes how a modern NASCAR stock car is built including the engine body and special safety features

From Hamiltonians to Phase Diagrams Jürgen Hafner, 2012-12-06 The development of the modern theory of metals and alloys has coincided with great advances in quantum mechanical many body theory in electronic structure calculations in theories of lattice dynamics and of the configurational thermodynamics of crystals in liquid state theory and in the theory of phase transformations For a long time all these different fields expanded quite independently but now their overlap has become sufficiently large that they are beginning to form the basis of a comprehensive first principles theory of the cohesive structural and thermodynamical properties of metals and alloys in the crystalline as well as in the liquid state Today we can set out from the quantum mechanical many body Hamiltonian of the system of electrons and ions and following the path laid out by generations of theoreticians we can progress far enough to calculate a pressure temperature phase diagram of a metal or a composition temperature phase diagram of a binary alloy by methods which are essentially rigorous and from first principles This book was written with the intention of confronting the materials scientist the metallurgist the physical chemist but also the experimental and theoretical condensed matter physicist with this new and exciting possibility Of course there are limitations to such a vast undertaking as this The selection of the theories and techniques to be discussed as well as the way in which they are presented are necessarily biased by personal inclination and personal expertise

Properties of the Color-Magnitude Diagrams of Type Ia Supernovae Lauren Aldoroty, 2024-11-25 This thesis presents a novel analysis of a photometric observational feature of Type Ia Supernovae SNe Ia the most precise distance indicators available for cosmological studies While SNe Ia are crucial for understanding modern cosmology there are systematic uncertainties associated with them that prevent use to their full potential It is therefore vital that sources of systematic error in SN Ia standardization are better understood In this thesis the author robustly connects the color magnitude diagram to SN Ia spectra and their physics for the first time and shows that for the SN sample in the dissertation this feature is important to consider as a contributor to scatter in the Hubble residual There is no prior work in the literature that examines this feature in such depth and it is rare to be able to paint such a thorough picture in a SN Ia study rooted in a single photometric feature This work opens up many avenues for future observational and theoretical studies
