Skwirzynski,2012-12-06 This volume contains the full proceedings of the Fourth Advanced Study Institute organised by myself and my colleagues in the field of Communication Theory and Allied Subjects In the first Institute we associated the subject of signal processing in communication with that in control engineering Then we concentrated on noise and random phenomena by bringing in as well the subject of stochastic calculus The third time our subject was multi user communication and associated with it the important problem of assessing algorithmic complexity This time we are concerned with the vast increase of computational power that is now available in communication systems processors and controllers This forces a mathematical algorithmic and structural approach to the solution of computational requirements and design problems in contrast to previous heuristic and intuitive methods We are also concerned with the interactions and trade offs between the structure speed and complexity of a process and between software and hardware implementations At the previous Advanced Study Institute in this series on Multi User Communications there was a session on computational complexity applied particularly to network routing problems It was the aim of this Institute to expand this topic and to link it with information theory random processes pattern analysis and implementation aspects of communication processors The first part of these proceedings concentrates on pattern and structure in communications processing In organising this session I was greatly helped and guided by Professor P G Farrell and Professor J L Massey   **Parallel Algorithms and Architectures for DSP Applications** Magdy A. Bayoumi,2012-12-06 Over the past few years the demand for high speed Digital Signal Proces sing DSP has increased dramatically New applications in real time image processing satellite communications radar signal processing pattern recogni tion and real time signal detection and estimation require major improvements at several levels algorithmic architectural and implementation These perfor mance requirements can be achieved by employing parallel processing at all levels Very Large Scale Integration VLSI technology supports and provides a good avenue for parallelism Parallelism offers efficient sohitions to several problems which can arise in VLSI DSP architectures such as 1 Intermediate data communication and routing several DSP algorithms such as FFT involve excessive data routing and reordering Parallelism is an efficient mechanism to minimize the silicon cost and speed up the pro cessing time of the intermediate middle stages 2 Complex DSP applications the required computation is almost doubled Parallelism will allow two similar channels processing at the same time The communication between the two channels has to be minimized 3 Applicatilm specific systems this emerging approach should achieve real time performance in a cost effective way 4 Testability and fault tolerance reliability has become

a required feature in most of DSP systems To achieve such property the involved time overhead is significant Parallelism may be the solution to maintain ac ceptable speed performance
