Abstract The purpose of this study was to determine the effect of a 12-week training program on the cardiovascular and muscular fitness of young adults. The subjects were 20 young adults (10 males and 10 females) who were randomly assigned to either a control group or a training group. The control group performed no exercise, while the training group performed a 12-week training program consisting of three sessions per week. The training program included cardiovascular exercise (running and cycling) and resistance training (weight lifting). The subjects were tested at baseline and at the end of the 12-week training program. The results of the study showed that the training group had significantly higher cardiovascular and muscular fitness than the control group at the end of the 12-week training program. The training program was effective in improving cardiovascular and muscular fitness in young adults.

valuable contributions to this book.

Unlike baropods, humans can't swim weight. They float over warm oceans when air pressure is low, which means the force of Earth's **atmosphere** is pressing downward with less force. When air pressure is low, air on Earth's surface can rise more easily.

Tornadoes are quite a bit smaller than hurricanes. Most tornadoes are less than a quarter of a mile wide. The longest ones can be more than a mile wide and 50 miles long. In contrast, a hurricane can measure 500 miles from side to side. Although hurricanes form over water, they can travel 200 miles or more over land before dying out.
