Industrial Engineering in Apparel Manufacturing Dr. Prabir Jana, Dr. Manoj Tiwari , 2020-03-11 While there is pressure from buyers inclination within

self to do better and a heightened aspiration among apparel manufacturers to use Industrial Engineering IE like other more industrialized sectors there is no specific book as such dealing with IE in relation to apparel manufacturing The existing books that are already written on IE possess academic rigour and generic functions applicable across industries thus making it difficult for the practitioners to refer and clear discrete doubts related to apparel manufacturing Undoubtedly work study is the centrepiece of Industrial Engineering however apart from work study industrial engineers in apparel industry are also supposed to perform various other functions like preparing operation breakdown and operation flow chart selecting machine type and attachment and workaids planning machine layout for maximizing unidirectional material movement optimising inventory and storage space and maintaining workplace health and safety These are some of the areas that often lack significant attention This practitioner s handbook is an amalgamation of theory and practices including steps of implementation and common mistakes A balanced approach is taken to make it equally meaningful and useful for the academics as well as the industry A unique section titled industry practices is incorporated at the end of each chapter which shares the typical practices constraints and benefits accrued by the industry which will give meaningful insight to the readers and help them relate theory with actual practice

Research Design for Combed Yarn Quality Dr. Sukhvir Singh,2023-05-22 The

aim of this study is to investigate the effects of finisher drawframe storage variables such as can spring stiffness sliver deposition rate and sliver coils position on the quality characteristics of the combed ring spun yarn The research design also

includes the effect of sliver storage time on the quality of stored sliver and subsequently on roving and yarn produced on speedframe and ringframe respectively. The critical role of storage can spring parameters on combed sliver roving and yarn quality has been frequently discussed in spinning preparatory literature. However, a clear understanding of the nature of relationships as mentioned above is not yet well established by the previous works. So there is a need to study the underlying factors at a deeper level that may provide further insight into ways to control ring yarn quality. Therefore, the present investigations were carried out to observe the effects of uncommon process parameters, namely can spring stiffness, delivery rate, and sliver coils position at post-comber drawing stage on sliver roving and yarn quality when slivers were allowed to feed without any storage time and after 8 hours storage time. The research plan was developed by implementing a three-factor, three-level Box-Behnken design of experiment. The effects of aforementioned variables were studied on combed yarn unevenness properties $U\%$, $CV_m\%$ and Imperfections, tensile properties, yarn tenacity and breaking elongation, and S3 hairiness. The results showed that the effects of can spring stiffness and sliver coils position are significant on yarn evenness, $CV_m\%$, imperfections, tenacity, and S3 hairiness. However, the combed yarn quality parameters did not show any significant relationships with the post-combing drawing delivery rate. It was observed that the combed yarn produced from bottom position sliver coils using older can spring showed less even yarn with improved imperfection, having less strength and more hairiness. The combed yarn quality further deteriorates on allowing 8 hours of sliver storage time. It was found that the bottom sliver coils experience the highest compressive forces compared to other sliver coils position, and adjacent sliver coils stickiness was observed, which results in sliver stretching and failure at the time of processing on speedframe. Also, older can spring of reduced spring stiffness results in buckling, which leads to stored sliver contact with rough sidewalls, causing weak, hairy sliver. The combed yarn samples produced from such storage cans lead to uneven yarn with more imperfections, weaker and hairy yarn structure. The contribution of sliver coils position was found highest, followed by can spring stiffness, in deciding combed yarn quality parameters in the current study. However, the effect of finisher drawframe delivery speed on yarn quality parameters was found minimal. Apart from this, an attempt has been made to understand the effect of dynamics of the can spring mechanism on combed sliver handling at the time of sliver deposition at drawframe through bond graph modeling approach. The behaviour of the can spring used for combed sliver storage was found linear, as expected. It was observed that bond graph modeling of can spring mechanism provides us information on more states in a systematic and algorithmic manner compared to any other technique. Linear momentum, linear displacement of top plate, force experienced by the combed sliver, and load versus displacement response of the mechanism were also studied. However, a more rigorous study is required to study the accurate dynamics of such precise systems because the force and the stresses experienced by the combed sliver are too low due to very low inter-fiber cohesion.
