Manual of Cable Osteosyntheses Reiner Labitzke, 2012-12-06 In bone surgery it is essential to compress fractures interfragmentarily in order to make them resistant to the tensile force of muscles and the force resulting from acceleration and deceleration This can be best achieved by the use of cable tension bands as a traction mechanism The cable tension band is in terms of stability of fractures far superior to the conventional rigid cerclage wire which has been widely used in osteosynthesis for over 100 years The author explains the biomechanics of the tension band in detail Theoretical findings are confirmed by clinical test results All osteosynthetic techniques which can be carried out with cables are described giving details of operation instructions Errors and risks are always pointed out A reference book and operative manual at a time

Merzaban, Monica M.

Burdick, Charles J. Dimitroff, 2020-05-26 Glycans represent a major constituency of post translational modifications that occur on most if not all proteins Whether on mammalian or invertebrate cell surfaces they exist as sugar chain moieties designed from the exquisite and coordinated activity of cell specific glycosylation Some of the more common glycan structures are

linked to cell surface polypeptides via an asparagine N linked residue or a serine threonine O linked residue along with a notable contingent found linked to ceramides in the lipid bilayer known as glycosphingolipids These glycans can associate with complementary glycan binding proteins GBP or lectins to mediate and translate this carbohydrate recognition to cell function In immunity there is increasing evidence that precise immune cell glycans are recognized by corresponding GBPs in a cell intrinsic or extrinsic manner Unique carbohydrate recognition domains within GBPs are comprised of precisely spaced amino acid functional groups that allow for selective engagement of a particular glycan target This structure function relationship is present in immune signaling pathways whereby glycans and GBPs on the surface of immune cells and non immune cells help control processes such as immune cell activation recognition of pathogens suppression and tissue specific migration The diversity of glycan structures and glycosylation among individual immune cell subsets is controlled by the expression of genes involved in glycan biosynthesis including glycosyltransferases glycosidases glycan precursor biosynthetic enzymes and nucleotide sugar transporters These genes represent more than 3% of the human genome and cell specific expression of these genes dictates a cell s glycan repertoire ultimately influencing its molecular interactions with GBPs Altogether these emerging lines of investigation highlight the regulatory capacity of glycans in immune health and disease which in turn pave the way for novel diagnostic prognostic and therapeutic strategies
