Accretion and Obscured Growth of Supermassive Black Holes Peter Boorman,2020-12-02 This thesis describes the
application of state of the art high energy X ray studies to the astronomical quest for understanding obscured active galactic
nuclei AGN These AGN are supermassive black holes growing by accretion of matter located in the nuclei of galaxies The
material that feeds these black holes also obscures them from view rendering them challenging to study It is possible to
study them by effectively X raying galactic nuclei to peer through these obscuring veils Beginning with the proof of concept
application of novel X ray Monte Carlo codes to the Nuclear Spectroscopic Telescope ARray NuSTAR spectrum of a known
heavily obscured AGN the thesis establishes the relevant parameters that characterise the AGN spectrum and central black
hole growth rate Next the largest sample of known heavily obscured AGN is compiled finding the strength of a prominent
iron spectral feature to weaken with AGN power This is puzzling and suggests that there may be more hidden AGN than
previously thought Finally by combining an all sky infrared selection with NuSTAR follow up new heavily obscured AGN are
identified Obscuration emits infrared radiation meaning that the infrared selected AGN catalogue should be representative of
the underlying AGN population The absence of such representative catalogues has continually plagued cosmological studies
and the resultant obscured AGN fraction will be strongly constraining for AGN models The Galaxy Mark Twain,1874
