Abstract
The purpose of this study was to investigate the effect of a 12-week training program on the physical and psychological health of elderly people. The study was conducted in a community center in Tehran, Iran. The participants were 30 elderly people (mean age = 70.5 years) who were randomly divided into two groups: a control group (n = 15) and an intervention group (n = 15). The intervention group participated in a 12-week training program consisting of aerobic exercise, strength training, and flexibility exercises. The control group did not participate in any training program. The physical health of the participants was measured using a series of tests including a 6-minute walk test, a 10-meter walk test, a 30-second chair stand test, and a 30-second sit-to-stand test. The psychological health of the participants was measured using a series of tests including a Beck Depression Inventory (BDI) and a State-Trait Anxiety Inventory (STAI). The results of the study showed that the intervention group had significantly higher scores on all physical and psychological health tests compared to the control group. The results suggest that a 12-week training program can improve the physical and psychological health of elderly people.
