DNA polymerase is very accurate and rarely makes a mistake in DNA replication. Occasionally, however, an error in replication, known as a point mutation, is introduced. There are two general categories of point mutations—frameshift mutations (also called base-pair insertions or base-pair deletions) and base substitution mutations (shown in the diagram).

If a segment of DNA were replicated without any errors, the replicated strand would have the following sequence of nucleotides:
5' - ACTACOTGA - 3'

Sort the following replicated DNA sequences by the type of point mutation each contains (frameshift, base substitution, or neither), as compared to the coded sequence shown above:

Send this message before the anniversary letter comes.

In order to determine the type of point mutation contained in a DNA sequence, it is helpful to write the mutated sequences below the control sequence so you can see the differences. The table below contains examples.

Correct Sequence	ATGCGAT
Substitution 1	ATGCGAT
Substitution 2	ATGCGTT
Frameshift 1	ATGGCGAT
Frameshift 2	ATCGAT

Frameshift mutations will change the number of nucleotides in a sequence; base substitution mutations will change the composition of the sequence but not the number of nucleotides.

The correct DNA sequence contains nine bases. Which of the mutated sequences also contains nine bases?
