

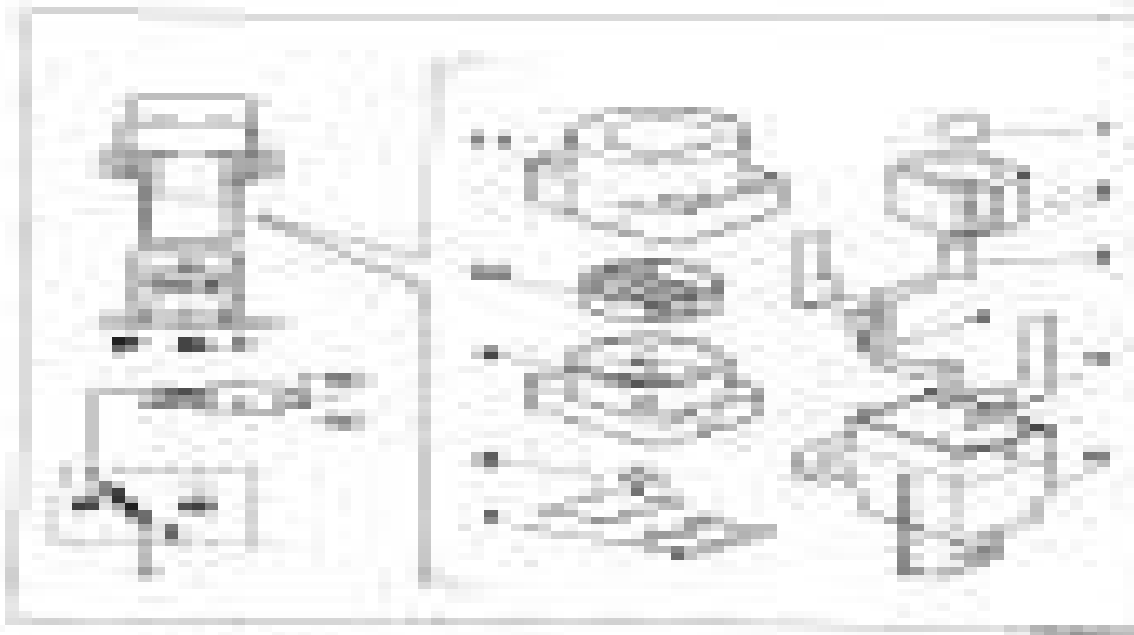

Diagram illustrating the greenhouse effect. Light rays from the sun enter the greenhouse and are reflected back inside, warming the interior.

The greenhouse effect is a natural process that warms the Earth's surface. When the Sun's rays hit the Earth, they are absorbed by the land and water. The surface then warms up and emits the heat as infrared radiation (heat) back towards the Earth. This is called the greenhouse effect. The greenhouse effect is what keeps the Earth warm enough to support life. Without it, the Earth would be too cold for most plants and animals to survive.

The greenhouse effect is caused by the presence of greenhouse gases in the atmosphere. These gases trap the heat that is emitted by the Earth's surface. The most common greenhouse gases are carbon dioxide (CO₂), methane (CH₄), and water vapor (H₂O). These gases are produced by natural processes, such as the decay of organic matter, and by human activities, such as the burning of fossil fuels.

The greenhouse effect is a natural process that has been occurring for billions of years. However, human activities have increased the concentration of greenhouse gases in the atmosphere, which has led to a warming of the Earth's surface. This is known as global warming. Global warming is a major concern because it can lead to a variety of problems, including rising sea levels, more frequent and severe weather events, and the extinction of many species.

- Greenhouse gases include:
- Carbon dioxide (CO₂)
 - Methane (CH₄)
 - Water vapor (H₂O)
 - Nitrous oxide (N₂O)
 - Ozone (O₃)
 - Hydrofluorocarbons (HFCs)
 - Perfluorocarbons (PFCs)
 - Sulfur hexafluoride (SF₆)
- These gases trap heat in the atmosphere, leading to global warming.
