Digital Human Modeling: Applications in Health, Safety, Ergonomics and Risk Management: Ergonomics and Health Vincent G. Duffy, 2015-07-20 The two volume set LNCS 9184 9185 constitutes the refereed proceedings of the 6th International Conference on Digital Human Modeling and Applications in Health Safety Ergonomics and Risk Management 2015 held as part of the 17th International Conference on Human Computer Interaction HCII 2015 held in Los Angeles CA USA in August 2015 The total of 1462 papers and 246 posters presented at the HCII 2015 conferences was carefully reviewed and selected from 4843 submissions These papers address the latest research and development efforts and highlight the human aspects of design and use of computing systems The papers thoroughly cover the entire field of human computer interaction addressing major advances in knowledge and effective use of computers in a variety of application areas The total of 96 contributions included in the DHM proceedings

were carefully reviewed and selected for inclusion in this two volume set The 52 papers included in this volume are organized in the following topical sections anthropometry and ergonomics motion modeling and tracking human modeling in transport and aviation human modeling in medicine and surgery quality in healthcare Virtual Reality Technologies and Real Life Applications Dina Darwish,2025-02-02 Virtual Reality sometimes known as VR is a technology that helps you feel as though you are completely submerged in a virtual world It provides a genuine sense of presence in the virtual realm which is a feeling that is quite distinct from the sensation of playing a game or navigating a 3D environment on a static 2D monitor One of the most common ways to accomplish this is by using a virtual reality headset which brings one or two displays very close to your eyes while also tracking your position so that it may be transformed into the virtual world Over the course of the last ten years the technology has seen tremendous development and advancement with the most advanced virtual reality headsets incorporating displays with an extremely high resolution motion controls that are becoming increasingly complex and even the capability to be used wirelessly The goal of virtual reality technology is to manufacture a three dimensional image or environment that is so realistic that it may be seen as real by a human being and even interact with in a manner that is realistic Although the level of immersion we are experiencing is not comparable to that of the Matrix the most recent generation of headsets games and virtual experiences can feel remarkably genuine In spite of the fact that you are aware that you are in a virtual environment it is still a lot of fun to interact with the world by using the natural motion of your body Motion controls can track your hands fingers and even facial expressions with certain headsets In order for virtual reality to function a small screen which is commonly an LCD or OLED panel with a high resolution is brought within a few inches of your eyes This is then coupled with stereoscopic lenses which distort the image in such a way that it appears to be three dimensional When you move your head around the headset will track your location and orientation It will then alter the visuals within the game to reflect your motions in the real world This will ensure that your movements in the virtual world are the same as they are in the actual world The fact that you can see your motion tracked hands or other appendages in addition to the all encompassing vision of the headset gives you the impression that you are genuinely present in the virtual environment that you are experiencing This is a very different concept from augmented reality AR which is a technology that superimposes virtual items onto the real world Your eyes are able to track and navigate via augmented reality thanks to the strong fixed points of reference that are there Virtual reality VR is a technology that simulates the entire world making it more difficult to achieve a realistic experience However in the consumer market virtual reality is often restricted to vision hearing and the ability to handle simple things However cutting edge virtual reality projects are working with tactile sensations and even scents The things that can be accomplished with just these senses however will astound you In the realm of virtual reality in the present era the virtual reality headset is the most essential component The screens that show the virtual world the lenses that make it appear three dimensional to your eyes and some kind of audio solution whether it be

speakers or headphones are often included in this piece of gear There is a comfy strap system that allows you to put the headset on your head and some headsets come equipped with built in cameras that allow for tracking Facial trackers and additional ports for the integration of accessories are among the others Some headsets such as the Valve Index are wired and require a direct connection to a powerful gaming personal computer in order to function On the other hand other headsets such as the Meta Quest 2 are designed to function independently and come equipped with a built in battery in addition to their own powerful processing capabilities Although there are virtual reality headsets that were meant to interact with mobile phones in the past these headsets are now considered obsolete and are largely underutilised In many instances the headset is the only piece of gear that is strictly necessary for you to enjoy virtual reality However the majority of virtual reality systems additionally utilise other components in order to make the experience function or at the very least to make it work better

Tracking parts On some headsets the tracking system is referred to as inside out tracking This method involves the incorporation of depth sensing cameras within the headset itself in order to determine its position On other headsets however the tracking system is external and must be put in the corners of the play space On the other hand some kind of accelerometer and gyroscope is incorporated into each and every headset in order to monitor the tilt and orientation of the headset

Controls Virtual reality headsets that are very simple allow for basic exploration and interaction with nothing more than a few buttons located on the headgear itself particularly older VR headsets that are operated by smartphones More modern virtual reality headsets come equipped with controllers that resemble handheld wands while the most powerful virtual reality systems feature controllers that are more subtle and can follow individual fingers There are virtual reality VR settings that are capable of monitoring hands and fingers without the need for any form of hardware controller Some of these systems even offer full body tracking which allows you to use your legs and feet as additional inputs Virtual reality games and experiences require a significant amount of computing power in order to depict them in a realistic manner even in headsets that are considered to be of lower quality In order to achieve this goal a virtual reality headset must either have its own processing capabilities built in or be connected to a powerful machine In the case of the PlayStation VR and PSVR2 this can be a PlayStation console but it can also be a desktop computer or a laptop The specifications of each of these headsets are different independent of the purpose for which they were designed In a variety of ways they can have an impact on the virtual reality headset as well as the users overall experience

Resolution This refers to the number of pixels that are displayed on the displays that are utilised in the headset It is expressed as an equation that is composed of the horizontal pixels multiplied by the vertical pixels Visuals that are presented to the user by headsets with a higher resolution are more clear and have fewer jagged edges The text is easier to read and objects that are further away can be recognised with more ease Virtual reality headsets of the first generation such as the Oculus Rift and the HTC Vive have combined resolutions of 2160 x 1600 for both eyes On the other hand the most recent generation of VR headsets such as the Pimax 5K Super have a

resolution of 5120 x 1440 The graphics processor is put under a greater amount of strain as the resolution of the headset is increased nonetheless there are headsets available with higher resolutions Refresh rate This refers to the number of times that the display can change what it displays in a single second and it is expressed as a Hertz Hz value A higher refresh rate can result in animations that are more fluid but it can also enhance immersion and lessen the likelihood of experiencing motion sickness A refresh rate of at least 90Hz is supported by the majority of virtual reality headsets however some headsets can handle 120Hz and some can support up to 180Hz Field of View The term field of view refers to the extent to which the view is provided by the headset itself While the majority of virtual reality headsets only offer up to 110 degrees of field of view the human eyes have a natural field of view that ranges from approximately 200 to 220 degrees It can be deduced from this that there are some black bands running along the sides as well as the top and bottom of the view however these bands are primarily on the borders Although it is uncommon some headsets are capable of supporting up to 200 degrees Your ability to feel more immersed in a game or event can be enhanced by having a larger field of view Lenses There are a fantastic variety of stereoscopic lenses available to choose from There are some of the most common Fresnel lenses although they have been criticised for having a relatively small sweet spot which is the point at which the virtual reality visuals are at their sharpest Additionally they have been criticised for producing light bloom in situations with a high contrast Many virtual reality headsets of the most recent generation make use of pancake lenses which are not only more compact and lightweight but also reduce the glare that is typically associated with Fresnel lenses In contrast they do not transfer light to the viewer as effectively which can result in visuals that are less vibrant or necessitate a significantly greater level of brightness from the display in order to compensate for this Audio Different headsets offer a variety of audio solutions with some headsets providing on ear headphones and others providing generic speakers that allow you to keep your ears open The second option may make it simpler to hear what is going on around you but it does not provide the same level of immersion Alternatively some headsets just come with a 3.5mm headphone socket which allows you to connect any earbuds or headphones that are compatible with the device Different headsets can have a significant impact on the quality of the sound they produce with the Valve Index headphones in particular receiving praise for performance Every headset has its own face plate its own weight and its own head strap design which all contribute to the overall comfort of the device Because of this the levels of comfort that each headset offers are radically different While some headsets are lightweight and well balanced allowing you to play for hours on end others may cause your face to become sore before there is enough time to play It is generally true that lighter headsets are more comfortable although there is no assurance of this What is the difference between wired and wireless headsets Some headsets such as the Valve Index are wired which means that they require a tethered connection to a gaming PC or console as well as a power source Some of them such as the Meta Quest Pro are completely self sufficient and function through wireless transmission A wireless kit can be used to upgrade other devices

such as the HTC Vive Pro 2 which is still available. Wireless headphones on the other hand provide more mobility and a greater sense of immersion in every circumstance but they do have to worry about battery life which can restrict the amount of time you can spend playing. It is also common for them to be heavier. It is true that wired headsets are more convenient and can provide higher quality uncompressed graphics but the wire can serve as a reminder that you are not in a virtual environment which prevents you from being fully immersed in the experience.

What Virtual Reality VR Can Do to Help Transform the Gaming Industry

Virtual reality VR technology has ushered in a new age for the gaming industry providing gamers with a level of immersion and interactivity that has never been seen before. By utilising high definition images, three dimensional audio and controls that are easy to use, virtual reality VR produces a gaming environment that is so immersive that it is difficult for traditional gaming platforms to compete with it.
