Hyaluronic Acid Unbiased Report:

Interaction between Hyaluronic Acid and Its Receptors (CD44, RHAMM) Regulates the Activity of Inflammation and Cancer David Naor, 2016-07-18 The biological outcome of Hyaluronan also hyaluronic acid abbreviated HA interaction with its CD44 or RHAMM receptors recently attracted much attention within the scientific community owing to a Nature article by Tian X et al Nature 2013 499 346 9 The article described a life span exceeding 30 years in naked mole rats whereas the maximal lifespan of mice to which the naked mole rat is related is only 4 years This observation is accompanied by the finding that the naked mole rat in contrast to the mouse does not develop spontaneous tumors during this exceptional longevity The article provides evidence that interaction of long tissue HA 6000 12 000 kDa of the naked mole rat with cell surface CD44 in contrast to the interaction of short tissue HA less than 3000 kDa with the mouse CD44 makes the difference More specifically this communication shows that the interaction of short HA with fibroblasts CD44 imposes on them susceptibility for malignant transformation whereas the corresponding interaction with long HA imposes on the fibroblasts a resistance to malignant transformation The article does not explain the mechanism that underlines these findings However the articles that will be published in the proposed Research Topic in the Inflammation section of Frontiers in Immunology can bridge not only this gap but also may explain why interaction between short HA and cell surface CD44 or RHAMM an additional HA receptor enhances the development of inflammatory and malignant diseases Furthermore the articles included in the proposed Frontiers Research Topic will show that cancer cells and inflammatory cells share several properties related to the interaction between short HA and cell surface CD44 and or RHAMM These shared properties include 1 Support of cell migration which allows tumor metastasis and accumulation of inflammatory cells at the inflammation site 2 Delivery of intracellular signaling which leads to cell survival of either cancer cells or inflammatory cells 3 Delivery of intracellular signaling which activates cell replication and population expansion of either cancer cells or inflammatory cells and 4 Binding of growth factors to cell surface CD44 of cancer cells or inflammatory cells i e the growth factors and their presentation to cells with cognate receptors endothelial cells fibroblasts leading to pro malignant or pro inflammatory activities Going back to the naked mole rat story we may conclude from the proposed articles of this Frontiers Research Topic that the long HA which displays anti malignant effect interferes with the above described pro malignant potential of the short HA perhaps by competing on the same CD44 receptor Extrapolating this concept to Inflammation the same mechanism competition may be valid for inflammatory and autoimmune activities If this is the case long HA may be used for therapy of both malignant and inflammatory diseases Moreover targeting the interaction between short HA and CD44 e g by anti CD44 blocking antibodies may display also a therapeutic effect on both malignant and inflammatory diseases an issue that encourages not only fruitful exchange of views but also practical experimental collaboration

Recent Advancements in Musculoskeletal

Regenerative Medicine Elizabeth Vinod, Csaba Matta, Boopalan Ramasamy, 2025-10-23 Musculoskeletal regenerative

medicine is a rapidly evolving field that focuses on the repair and regeneration of tissues such as cartilage and bone which are often compromised due to injury or degenerative diseases Despite the availability of various clinical interventions these tissues have a limited capacity for self repair necessitating the development of innovative therapeutic strategies Recent advancements have been made by integrating cell based techniques with orthobiologics which include biological materials like platelet rich plasma PRP and growth factors to enhance tissue regeneration The latest studies have demonstrated the potential of combining stem cells with bioengineered scaffolds to create an optimal environment for tissue growth and integration However challenges remain in replicating the complex structure and function of native tissues and there is a pressing need for further research to refine these approaches and improve clinical outcomes This Research Topic aims to explore the most advanced protocols and procedures that can serve as tools to enhance the healing of musculoskeletal disorders The primary objective is to provide a comprehensive overview of innovative strategies that can be translated into clinical practice addressing the limitations of current therapies Key questions include how to effectively combine cell based and cell free approaches the role of orthobiologics in tissue repair and the potential of emerging stem cell therapies in treating chondral pathologies To gather further insights in the field of musculoskeletal regenerative medicine we welcome articles addressing but not limited to the following themes Cell free and cell based approaches in cartilage repair and regeneration Chondral pathologies and emerging stem cell therapies Orthobiologics in chondral pathologies Advancements in scaffolds for musculoskeletal repair Role of subchondral bone in cartilage health and repair Please note systematic reviews are not accepted by Frontiers in Cell and Developmental Biology and if in scope should be submitted to Frontiers in Bioengineering and Biotechnology Biomaterials *Journal of the National Cancer Institute* ,1990 **Kelley's Textbook of Rheumatology** Gary S.
