### Theory of Intelligence

- Intelligence is the capacity to acquire and apply knowledge
- Intelligence includes the ability to benefit from experience, act purposefully, solve problems, and adapt to new situations
- Charles Spearman proposed a general intelligence factor,  $g$ , that underlies all intelligent behavior
- Howard Gardner proposed that there are eight domains of intelligence
- Howard Sternberg distinguished among three aspects of intelligence
- Emotional intelligence helps people to perceive, regulate, understand, and regulate emotions

### Intelligence Testing

- The most commonly used individual tests of intelligence are the Stern-Benett scale, the Wechsler-Binet Scale, and the Wechsler Adult Intelligence Scale
- The Stern-Benett scale yielded scores in terms of mental age
- The original Stern-Benett test yielded scores in terms of intelligence quotient, or  $IQ$
- The Wechsler test yields scores based on a normal distribution
- Although the term  $IQ$  is still used, current intelligence tests present scores based on a normal distribution
- Group intelligence tests are often used in educational settings
- Some researchers have suggested that there are biological indices of intelligence, such as reported brain and personality speed
- Many psychologists believe that cultural bias affects intelligence tests
- Intelligence tests are standardized
- Testing provides information about how a child compares with other people's scores
- Intelligence tests are very reliable
- Intelligence tests are reasonably valid measures of academic ability
- Intelligence tests have both limits and advantages

### The Influence of Heredity and Environment

- There is dispute about how and how much heredity and environment affect intelligence
- Evidence for hereditary influences comes from family studies, twin studies, and adoption studies
- Hereditary influences for intelligence vary depending on the method used for estimation
- Evidence for environmental influences comes from adoption studies, studies of environmental deprivation, and the Flynn effect
- There is probably a hereditary range for  $IQ$ . Hereditary range refers to range, not to  $IQ$ . The hereditary contribution determines where  $IQ$  will be within
