

SPERMATOPHYTES

Notes (Study) Spermatophytes and Gymnosperms

1. Spermatophytes and Gymnosperms: Differences in Reproduction and Development

Spermatophytes: Spermatophytes are plants in the phylum *Spermatophyta* that produce seeds. They are characterized by the presence of a seed coat and a protective layer called the integument.

Gymnosperms: Gymnosperms are plants in the phylum *Gymnosperms* that produce seeds. They are characterized by the presence of a seed coat and a protective layer called the integument.

For spermatophytes, reproduction involves a long period of dormancy, often years, before the seedling emerges.

In gymnosperms, the seedling emerges soon after germination, often within a few weeks or months. The seedling is usually protected by a protective layer called the integument.

Reproduction: Spermatophytes and gymnosperms have different reproductive strategies. Spermatophytes have a more complex reproductive system, involving a long period of dormancy before the seedling emerges.
