Gnomon Measuring The Shadows:

Sticks, Stones, and Shadows Martin Isler, 2001 What do the pyramids of Egypt really represent What could have driven so many to so great and often so dangerous an effort Was the motivation religious or practical Illustrated with more than 300 photographs and drawings this book presents an original approach to the subject of pyramid building It reveals the connection between devices that served both a practical need for survival and a spiritual belief in gods and goddesses It examines Egyptian technologies and techniques from the origins of pyramid development to the step by step details of how the ground was leveled how the site was oriented and how the stone was raised and placed to meet at a distant point in the sky Here the author also asks and answers questions virtually ignored for the last century He discloses for example the ancient use of shadows now denigrated to the ornamental back yard sundial but once an important tool for telling the height of an object geographical directions the seasons of the year and the time of day He also reinterprets the ancient stretching of the cord ceremony which once was thought to have only religious significance but here is shown as the means of establishing the sides of a pyramid

Portraits of the Earth Timothy G. Feeman, 2002 Every map is a tool a product of human effort and creativity that represents some aspects of our world or universe This course was

powered by the belief that by exploring the mathematical ideas involved in creating and analyzing maps students would see how mathematics could help them to understand and explain their world from the Preface Portraits of the Earth exemplifies the AMS's mission to bring the power and vitality of mathematical thought to the nonexpert. It is designed to teach students to think logically and to analyze the technical information that they so readily encounter every day. Maps are exciting visual tools that we encounter on a daily basis from street maps to maps of the world accompanying news stories to geologic maps depicting the underground structure of the earth. This book explores the mathematical ideas involved in creating and analyzing maps, a topic that is rarely discussed in undergraduate courses. It is the first modern book to present the famous problem of mapping the earth in a style that is highly readable and mathematically accessible to most students. Feeman's writing is inviting to the novice yet also interesting to readers with more mathematical experience. Through the visual context of maps and mapmaking, students will see how contemporary mathematics can help them to understand and explain the world. Topics explored are the shape and size of the earth, basic spherical geometry, and why one can't make a perfect flat map of the planet. The author discusses different attributes that maps can have and determines mathematically how to design maps that have the desired features. The distortions that arise in making world maps are quantitatively analyzed. There is an in-depth discussion on the design of numerous map projections, both historical and contemporary, as well as conformal and equal area maps. Feeman looks at how basic map designs can be modified to produce maps with any center, and he indicates how to generalize methods to produce maps of arbitrary surfaces of revolution. Also included are end-of-chapter exercises and laboratory projects. Particularly interesting is a chapter that explains how to use Maple, a software package to make maps from geographic data points. This book would make an excellent text for a basic undergraduate mathematics or geography course and would be especially appealing to the teacher who is interested in exciting visual applications in the classroom. It would also serve nicely as supplementary reading for a course in calculus, linear algebra, or differential geometry. Prerequisites include a solid grasp of trigonometry and basic calculus. R. Stonehenge Time Kaia Stonebrook, AI, 2025-03-04 Stonehenge Time explores the idea that ancient megalithic sites like Stonehenge were sophisticated astronomical observatories and calendar systems It examines whether these monuments were intentionally designed to track celestial movements offering insights into the intellectual capabilities of early societies Discover the potential use of these sites for predicting seasons and the cultural significance of timekeeping in early societies The book journeys through archaeoastronomy analyzing astronomical alignments corresponding to solar and lunar events It investigates how timekeeping and astronomical knowledge influenced ancient beliefs and practices The approach is to guide the reader through the main concepts of archaeoastronomy by providing a detailed analysis of Stonehenge a comparative study of other sites worldwide and an exploration of the cultural context The text argues that megalithic structures represent deliberate attempts to codify the cosmos integral to survival and cultural identity This challenges the notion that complex astronomical knowledge is a product of advanced civilizations With evidence including surveys statistical analyses and reinterpretations of archaeological data the book progresses from introducing archaeoastronomy to analyzing Stonehenge comparing global sites and exploring cultural contexts
