Multiple and conflicting objectives of stakeholders including suppliers, manufacturers, service providers and retailers add to the complexity of decisions that modern day managers of supply chains face. With the unprecedented technological developments and innovations at hand, sustainability can be maximized for all the activities of a supply chain including service concept and product design, material sourcing and procurement, manufacturing processes, delivery of the final product and end of life management of the product. Consequently the sustainable supply chains problems require a systematic and integrated approach. Modeling and simulation in general as well as system dynamics and agent based modeling in particular have the capabilities to deal with the complexity of sustainable supply chain related problems. This book will appeal to professionals and researchers in the field.
