

The Cell Cycle

What controls the life and development of a cell?

why?

An old piece of poetry says "to everything there is a season... a time to be born, a time to die." For cells, the line might say "a time to divide and a time to grow." In multicellular organisms, different types of cells have different roles and need to complete specific tasks. For example, a cell that isn't large enough is not useful for storing nutrients for later, but a cell that is too large will not be useful for transportation through a tiny capillary. In this activity, you will learn about the seasons of a cell's life, and in turn better understand how organisms function.

Model 1 - The cell cycle

1. How many phases are in the cell cycle as shown in the diagram in Model 1?

Four.

2. Starting at the starred cell, what is the order of the stages of a cell's life?

1' 2'

3. During which phase does the size of the cell increase?

4. During which phase does the number of cells increase?

M.

5. Considering your answer to Questions 3 and 4, identify two ways that the growth of an organism can be accomplished through the events of the cell cycle.

Growth can happen when cells increase in size or when the number of cells in an organism increases (this takes place during G1 and M, respectively).

Model The Cell Cycle Answer Key:

Cell Cycle Regulation and Development in Alphaproteobacteria Emanuele Biondi,2022-03-14 This book provides a comprehensive overview of the cell cycle regulation and development in Alphaproteobacteria Cell cycle and cellular differentiation are fascinating biological phenomena that are highly regulated in all organisms In the last decades many laboratories around the world have been investigating these processes in Alphaproteobacteria This bacterial class comprises important bacterial species studied by fundamental and applied research The complexity of cell cycle regulation and many examples of cellular differentiations in this bacterial group represent the main motives of this book The book starts with discussing the regulation of cell cycle in alphaproteobacterial species from a system biology perspective The following chapters specifically focus on the model species *Caulobacter crescentus* multiple layers of regulation from transcriptional cascades to proteolysis and dynamic subcellular regulation of cell cycle regulators In addition the cell division process chromosome segregation and growth of the cell envelope is described in detail The last part of the book covers examples of non *Caulobacter* alphaproteobacterial models such as *Agrobacterium tumefaciens* *Brucella* species and *Sinorhizobium meliloti* and also discusses possible applications This book will be of interest to researchers in microbiology and cell biology labs working on cell cycle regulation and development
