Weed Science ,1989 **Soil Survey, Fairbanks Area, Alaska** Samuel Rieger,1963 **Soil Survey** ,1963 **The Reticuloendothelial System and Atherosclerosis** Rodolfo Paoletti,2013-03-09 The circulatory system is usually considered to be composed of tubes of various diameters characterized by collateral and terminal branches There is also a tendency to treat blood vessels merely as conducting tubes in which the various structures of the wall act as mechanical pumps whrch modify their diameter This is of course not so In fact we know that blood vessels and in particular arteries are organs with personalities of their own and a particular susceptibility to several diseases In addition blood vessels differ in structure according to their localization and age at differing rates The experimental work car ried out so far clearly confirms

the data that have come from spontaneous human pathology experimentally induced arterial lesions have a definite tendency to appear in certain arteries and not in others depending on the experimental procedures used and in each specific artery the lesions appear to have a specific location We now know that the arterial wall is a metabolically active structure in which a number of enzyme activities have been clearly demonstrated It possesses a sensitive vasa vasorum apparatus and a specific reactivity to various lesion inducing stimuli We must also remember that the arterial wall is in continuous contact with the blood circulating through the endothelial cells lining the vascular bed It is obvious therefore that any variation in the circulating blood mass can modify the morphology as well as the function of the vessel wall
