Crystallization of Polymers: Volume 1, Equilibrium Concepts Leo Mandelkern, 2002-09-19 First published in 2002 from an original 1964 edition in the Crystallization of Polymers 2nd edition Leo Mandelkern provides a self contained treatment of polymer crystallization All classes of macromolecules are included and the approach is through the basic disciplines of chemistry and physics The book discusses the thermodynamics and physical properties that accompany the morphological and structural changes that occur when a collection of molecules of very high molecular weight are transformed from one state to another Volume 1 is a presentation of the equilibrium concepts that serve as a basis for the subsequent volumes In this volume the author shows that knowledge of the equilibrium requirements is vital to understanding all aspects of the polymer crystallization process and the final state that eventually evolves This book will be an invaluable reference work for all chemists physicists and materials scientists who work in the area of polymer crystallization

Chemical Engineering Design and Analysis T. Michael Duncan, Jeffrey A. Reimer, 2019-01-24 The go to guide to learn the principles and practices of design and analysis in chemical engineering Macromolecular Physics Bernhard Wunderlich, 2013-10-22 This third volume completes the first part of the project Macromolecular Physics The first volume dealt with the description of macromolecular crystals the second volume dealt with crystal growth and the third volume summarizes our knowledge of the melting of linear flexible macromolecules The discussion in the three volumes goes from reasonably well established topics such as the structure morphology and defects in crystals to topics still in flux such as crystal nucleation detailed growth mechanisms and annealing processes to arrive at the present topics of equilibrium nonequilibrium and copolymer melting Our knowledge is quite limited on many aspects of these latter topics

Physico-Chemical Properties of Selected Anionic, Cationic and Nonionic Surfactants N.M. van Os, J.R. Haak, L.A.M. Rupert, 2012-12-02 The number of physico chemical investigations of surfactants in solution whether aqueous or nonaqueous has dramatically increased in recent years However literature reports on surfactants in solutions are scattered over a plethora of scientific journals and books which differ widely in scope and readership Such data are often difficult to retrieve because there have been no systematic compilations with the exception of those for CMCs and for micelle aggregation numbers The present compilation meets that need by covering as completely as possible the physico chemical properties of selected series of homologous surfactants These surfactants are in most cases isomerically pure are well known and have been used in numerous academic and industrial studies The properties include aggregation number cloud point CMC ^{13}C NMR correlation length counterion binding density enthalpy of micelle formation entropy of micelle formation Gibbs free energy of micelle formation head group area ^1H NMR hydration number Krafft temperature melting point micelle radius microscopic viscosity miscibility curve partial molar volume phase inversion temperature refractive index self diffusion coefficient surface tension and upper critical temperature The book also contains two and three component phase diagrams

of many nonionic surfactants The solvent is water in most cases however some data refer to properties in D2O electrolyte solutions and nonaqueous solvents The variables are temperature and concentration Where possible the method of measurement is given Data on the purity of the compounds and the accuracy of the measurement methods are not included as these can easily be found in the original sources which mostly date from the period 1970 1991 and are given at the end of each chapter The Index section contains a compound index a property index a symbol index and a cross index which facilitate easy access to the data This valuable collection of data will be of great use to anyone involved in Colloid and Surface Science academics as well as industrial workers and will stimulate further work

Fundamentals of Chemical Engineering

Thermodynamics Themis Matsoukas, 2013 Fundamentals of Chemical Engineering Thermodynamics is the clearest and most well organized introduction to thermodynamics theory and calculations for all chemical engineering undergraduates This brand new text makes thermodynamics far easier to teach and learn Drawing on his award winning courses at Penn State Dr Themis Matsoukas organizes the text for more effective learning focuses on why as well as how offers imagery that helps students conceptualize the equations and illuminates thermodynamics with relevant examples from within and beyond the chemical engineering discipline Matsoukas presents solved problems in every chapter ranging from basic calculations to realistic safety and environmental applications

Thermal Analysis of Polymeric Materials Bernhard Wunderlich, 2005-12-06 Thermal analysis is an old technique It has been neglected to some degree because developments of convenient methods of measurement have been slow and teaching of the understanding of the basics of thermal analysis is often wanting Flexible linear macromolecules also not as accurately simply called polymers make up the final third class of molecules which only was identified in 1920 Polymers have never been fully integrated into the disciplines of science and engineering This book is designed to teach thermal analysis and the understanding of all materials flexible macromolecules as well as those of the small molecules and rigid macromolecules The macroscopic tool of inquiry is thermal analysis and the results are linked to microscopic molecular structure and motion Measurements of heat and mass are the two roots of quantitative science The macroscopic heat is connected to the microscopic atomic motion while the macroscopic mass is linked to the microscopic atomic structure The macroscopic units of measurement of heat and mass are the joule and the gram chosen to be easily discernable by the human senses The microscopic units of motion and structure are 12 10 the picosecond 10 seconds and the angstrom 10 meters chosen to fit the atomic scales One notes a factor of 10 000 between the two atomic units when expressed in human units second and gram with one gram being equal to one cubic centimeter when considering water Perhaps this is the reason for the much better understanding and greater interest in the structure of materials being closer to human experience when compared to molecular motion
